## Chapter 20 <br> Practice Test 1

# Math Test - No Calculator <br> 25 MINUTES, 20 QUESTIONS 

Turn to Section 3 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-15, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 16-20, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 16 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is not permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$A=\pi r^{2}$
$C=2 \pi r$

$V=\ell w h$

$V=\pi r^{2} h$

$V=\frac{4}{3} \pi r^{3}$

$V=\frac{1}{3} \pi r^{2} h$

$V=\frac{1}{3} \ell w h$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

1
Which of the following equations has a vertex of $(3,-3)$ ?
A) $y=5(x-3)^{2}-3$
B) $y=5(x+3)^{2}-3$
C) $y=5(x-3)^{2}+3$
D) $y=5(x+3)^{2}+3$

A beverage store charges a base price of $x$ dollars for one keg of root beer. A sales tax of a certain percentage is applied to the base price, and an untaxed deposit for the keg is added. If the total amount, in dollars, paid at the time of purchase for one keg is given by the expression $1.07 x+17$, then what is the sales tax, expressed as a percentage of the base price?
A) $0.07 \%$
B) $1.07 \%$
C) $7 \%$
D) $17 \%$

Syed took out a cash advance of $d$ dollars from a financing company. The company deducts a fee of $\frac{1}{3}$ of the original advanced amount along with a wire transfer fee of $\$ 30.00$. Which of the following represents the final advanced amount that Syed receives after all applied fees, in dollars?
A) $\frac{1}{3} d-30$
B) $\frac{1}{3}(d-30)$
C) $\frac{2}{3}(d-30)$
D) $\frac{2}{3} d-30$

## 4

What is the equation of a line that contains the point $(1,6)$ and has a $y$-intercept of 4 ?
A) $y=\frac{1}{2} x+4$
B) $y=x+4$
C) $y=2 x+4$
D) $y=4 x+2$

5
The number of bonus points, $B(p)$, that a credit card holder receives is given by the function $B(p)=4 p+7$, where $p$ represents the number of purchases made. If the number of purchases is increased by 3 , by how much does the number of bonus points increase?
A) 3
B) 4
C) 12
D) 19

## 6

Jeff tests how the total volume occupied by a fluid contained in a graduated cylinder changes when round marbles of various sizes are added. He found that the total volume occupied by the fluid, $V$, in cubic centimeters, can be found using the equation below, where $x$ equals the number of identical marbles Jeff added, one at a time, to the cylinder, and $r$ is the radius of one of the marbles.

$$
V=24 \pi+x\left(\frac{4}{3} \pi r^{3}\right)
$$

If the volume of the graduated cylinder is $96 \pi$ cubic centimeters, then, what is the maximum number of marbles with a radius of 3 centimeters that Jeff can add without the volume of the fluid exceeding that of the graduated cylinder?
A) 1
B) 2
C) 3
D) 4

If $b$ is two more than one-third of $c$, which of the following expresses the value of $c$ in terms of $b$ ?
A) $c=\frac{b-2}{3}$
B) $c=\frac{b+2}{3}$
C) $c=3(b-2)$
D) $c=3(b-6)$

The rotation rate of a mixing blade, in rotations per second, slows as a liquid is being added to the mixer. The blade rotates at 1,000 rotations per second when the mixer is empty. The rate at which the blade slows is four rotations per second less than three times the square of the height of the liquid. If $h$ is the height of liquid in the mixer, which of the following represents $R(h)$, the rate of rotation?
A) $4-9 h^{2}$
B) $1,000-(4-3 h)$
C) $1,000-(9 h-4)$
D) $1,000-\left(3 h^{2}-4\right)$

A dental hygiene company is creating a new 24 -ounce tube of toothpaste by combining its most popular toothpastes, Cavity Crusher and Bad Breath Obliterator. Cavity Crusher contains 0.25\% of sodium fluoride as its active ingredient, and Bad Breath Obliterator contains $0.30 \%$ of triclosan as its active ingredient for a total of 0.069 ounces of active ingredients in both toothpastes. Solving which of the following systems of equations yields the number of ounces of Cavity Crusher, $c$, and the number of ounces of Bad Breath Obliterator, $b$, that are in the new toothpaste?
A) $\quad c+b=0.069$

$$
0.25 c+0.3 b=24
$$

B) $\quad c+b=24$

$$
0.0025 c+0.003 b=0.069
$$

C) $\quad c+b=24$

$$
0.025 c+0.03 b=0.069
$$

D) $\quad c+b=24$

$$
0.25 c+0.3 b=0.069
$$

10

$$
\frac{2 d^{2}-d-10}{d^{2}+7 d+10}=\frac{d^{2}-4 d+3}{d^{2}+2 d-15}
$$

In the equation above, what is the value of $d$ ?
A) -4
B) 2
C) 4
D) 6

11
Which of the following is a possible equation for a circle that is tangent to both the $x$-axis and the line $x=4$ ?
A) $(x+2)^{2}+(y+2)^{2}=4$
B) $(x+2)^{2}+(y-2)^{2}=4$
C) $(x-2)^{2}+(y+4)^{2}=4$
D) $(x-6)^{2}+(y-2)^{2}=4$

12
Reactant A is placed in a beaker, to which Reactant B will be added. Reactants A and B will not react unless $B$ gets to a certain concentration. Once the reaction starts, both concentrations decrease until B has been consumed. Which of the following graphs, showing concentration in moles as a function of time in seconds, represents the reaction?
A)

B)

C)

D)

13

$$
\begin{aligned}
-2 y & \leq 8 \\
y-3 & \leq x \\
-\frac{1}{3} y+1 & \geq x
\end{aligned}
$$

Which of the following graphs shows the solution to the system of inequalities above?
A)

B)

C)

D)

14

If rectangle $A B C D$ has an area of 324 and the tangent of $\angle B C A$ (not shown) is $\frac{4}{9}$, then which of the following is closest to the length of $\overline{B D}$ (not shown)?
A) 9.8
B) 27
C) 29.5
D) It cannot be determined from the given information.

Which of the following is equivalent to
$\frac{2 m+6}{4} \times \frac{6 m-36}{3 m+9}$ ?
A) $\frac{12 m^{2}-216}{12 m+36}$
B) $\frac{8 m-30}{3 m+13}$
C) $\frac{m-6}{4}$
D) $m-6$

A rectangular box has sides 3,4 , and $x$ and a volume of 18 . What is the value of $x$ ?

17
Jeanne babysits Chuy one day each week. Jeanne charges a $\$ 20$ fee for the day, plus $\$ 5.50$ for every 30 minutes of babysitting. How much has Jeanne earned after three hours of babysitting? (Disregard the $\$$ sign when gridding your answer.)

The parabola $y=-x^{2}+5 x+6$ is intersected by the line $y=-\frac{1}{2} x+12$. What is the $y$-coordinate of the intersection closest to the $x$-axis?

$$
\begin{aligned}
13 r+8 v & =47 \\
22 v & =63-17 r
\end{aligned}
$$

Based on the system of equations above, what is the sum of $r$ and $v$ ?

A gardener has a cultivated plot that measures 4 feet by 6 feet. Next year, she wants to double the area of her plot by increasing the length and width by $x$ feet. What is the value of $x$ ?

## Math Test - Calculator

## 55 MINUTES, 38 QUESTIONS

Turn to Section 4 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-30, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 31-38, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 31 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$C=2 \pi r$

$V=\frac{4}{3} \pi r^{3}$

$V=\frac{1}{3} \pi r^{2} h$
Special Right Triangles

$V=\frac{1}{3} \ell w h$
$V=\ell w h$

$$
V=\pi r^{2} h
$$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

1
The population, $P$, of Town $Y$ since 1995 can be estimated by the equation $P=1.0635 x+3,250$, where $x$ is the number of years since 1995 and $0 \leq x \leq 20$. In the context of this equation, what does the number 1.0635 most likely represent?
A) The estimated population of town $Y$ in 1995
B) The estimated population of town $Y$ in 2015
C) The factor by which the population of town $Y$ increased yearly
D) The factor by which the population of town $Y$ decreased yearly

2
If $x^{2}+12 x=64$ and $x>0$, what is the value of $x$ ?
A) 2
B) 4
C) 8
D) 16

## 3

Sai is ordering new shelving units for his store. Each unit is 7 feet in length and extends from floor to ceiling. Sai's store has 119 feet of wall space that includes 21 feet of windows along the walls. If the shelving units cannot be placed in front of the windows, which of the following inequalities includes all possible values of $r$, the number of shelving units that Sai could use?
A) $r \leq \frac{119-21}{7}$
B) $r \geq \frac{119+21}{7}$
C) $r \leq 119-21+7 r$
D) $r \geq 119+21-7 r$

4
Truffula Tree Fruit Weight

The scatterplot above shows the weight, in ounces, of the fruits on a certain truffula tree from days 55 to 85 after flowering. According to the line of best fit in the scatterplot above, which of the following is the closest approximation of the number of days after flowering of a truffula fruit that weighs 5.75 ounces?
A) 63
B) 65
C) 77
D) 81

5
Hannah placed an online order for shirts that cost $\$ 24.50$ per shirt. A tax of $7 \%$ is added to the cost of the shirts, before a flat, untaxed shipping rate of $\$ 6$ is charged. Which of the following represents Hannah's total cost for $s$ shirts, in dollars?
A) $0.07(24.50 s+6)$
B) $1.07(24.50+6) \mathrm{s}$
C) $1.07(24.50 s)+6$
D) $1.07(24.50+s)+6$

## 6

Once a certain plant begins to grow, its height increases at a linear rate. After six weeks, the plant is 54 centimeters tall. Which of the following functions best models the relationship between $h(w)$, the height, in centimeters, of the plant, and $w$, the number of weeks that the plant has been growing?
A) $h(w)=6 w$
B) $h(w)=9 w$
C) $h(w)=54 w$
D) $h(w)=54+w$

Which of the following is equivalent to $\left(12 x^{2}+4 x+5 y\right)$ $+\left(3 x^{2}-2 x+3 y\right)$ ?
A) $2 x^{2}-2 x+8 y$
B) $2 x^{2}+15 x+8 y$
C) $15 x^{2}-2 x+8 y$
D) $15 x^{2}+2 x+8 y$

An advertisement for Royal Rat Rations states: " 7 out of 8 veterinarians recommend Royal Rat Rations for your fancy rat." No other information about the data is provided by the company.

Based on this data, which of the following inferences is most valid?
A) Royal Rat Rations provides the best nutrition for fancy rats.
B) If you do not feed your rat Royal Rat Rations, your rat will be unhealthy.
C) Only one veterinarian does not recommend Royal Rat Rations for your fancy rat.
D) Of the veterinarians surveyed by Royal Rat Rations, the majority recommend Royal Rat Rations for your fancy rat.

$$
\frac{1}{2} t+4=\frac{3}{4} t-5
$$

In the equation above, what is the value of $t$ ?
A) 4
B) 9
C) 18
D) 36

Dogs need 8.5 to 17 ounces of water each day for every 10 pounds of their weight. Everett has two dogs-Ringo is a 35 -pound black lab mix, and Elvis is a 55-pound beagle. Which of the following ranges represents the approximate total number of ounces of water, $w$, that Elvis and Ringo need in a week?
A) $77 \leq w \leq 153$
B) $109 \leq w \leq 218$
C) $536 \leq w \leq 1,071$
D) $765 \leq w \leq 1,530$

11
Priya is planning to send her favorite dry rub recipe to a friend who lives in France. Before sending the recipe, Priya wants to convert the American customary units in the instructions into metric units so that her friend will easily be able to understand the measurements. If the recipe calls for a ratio of four ounces of paprika to every seven ounces of chili powder, and if Priya's friend is planning to make a large batch of dry rub with 91 total ounces of chili powder, approximately how many total grams of paprika and chili powder will the recipe require? (1 ounce $=28.3$ grams)
A) $4,047 \mathrm{grams}$
B) $4,521 \mathrm{grams}$
C) 4,925 grams
D) 5,149 grams

12
Luciano measured the amount of water that evaporated over a period of time from a container holding $w$ ounces of water, where $w$ is greater than 12. By the end of the first day, the cup had lost 2 ounces of water. By the end of the 7th day, the cup had lost an additional 8 ounces of water. By the end of the 11th day, the cup had lost half of the water that remained after the 7th day. Which of the following represents the remaining amount of water, in ounces, in Luciano's container at the end of the 11th day?
A) $\frac{w-2}{8}$
B) $\frac{w-2}{2}-10$
C) $\frac{1}{2} w-10$
D) $\frac{w-10}{2}$

Questions 13 and 14 refer to the following information.
In the 1990s, the park rangers at Yellowstone National Park implemented a program aimed at increasing the dwindling coyote population in Montana. Results of studies of the coyote population in the park are shown in the scatterplot below.

Coyote Population in Yellowstone Park

13
Based on the line of best fit in the scatterplot above, which of the following is the closest to the average annual increase in coyotes in Yellowstone Park between 1995 and 2000 ?
A) 22
B) 24
C) 26
D) 28

14
According to the data in the scatterplot, which of the following best represents the percent increase between the median of the results of the studies from 1995 and the median of the results of the studies from 1996?
A) $50 \%$
B) $100 \%$
C) $150 \%$
D) $200 \%$

4

## 15

Bailey's Boutique Clothing is having a $20 \%$ off sale during which shirts cost $\$ 30.00$ and pants cost $\$ 60.00$.
On the day of the sale, Bailey's sells a total of 60 shirts and pants and earned a total of $\$ 2,250$. On a regular day, Bailey's sells $\frac{2}{3}$ the number of shirts and pants sold during the sale and earns a total of $\$ 1,875$. Solving which of the following systems of equations yields the number of shirts, $s$, and the number of pants, $p$, sold during a regular day?
A) $s+p=40$
$37.5 s+75 p=1,875$
B) $s+p=40$
$30 s+60 p=2,250$
C) $s+p=60$
$30 s+60 p=2,250$
D) $s+p=2,250$
$30 s+60 p=60$

16
Bryan, who works in a high-end jewelry store, earns a base pay of $\$ 10.00$ per hour plus a certain percent commission on the sales that he helps to broker in the store. Bryan worked an average of 35 hours per week over the past two weeks and helped to broker sales of $\$ 5,000.00$ worth of jewelry during that same two-week period. If Bryan's earnings for the two-week period were $\$ 850.00$, what percent commission on sales does Bryan earn?
A) $1 \%$
B) $2 \%$
C) $3 \%$
D) $4 \%$

17
If $\frac{(C+x)}{x-3}=\frac{x+8}{3}$, which of the following could be an expression of $C$ in terms of $x$ ?
A) $3(1+x)$
B) $x^{2}+2 x-24$
C) $\frac{1}{3}(x+6)(x-4)$
D) $\frac{1}{3}(x-3)(x+8)$

Lennon has 6 hours to spend in На Ha Tonka State Park. He plans to drive around the park at an average speed of 20 miles per hour, looking for a good trail to hike. Once he finds a trail he likes, he will spend the remainder of his time hiking it. He hopes to travel more than 60 miles total while in the park. If he hikes at an average speed of 1.5 miles per hour, which of the following systems of inequalities can be solved for the number of hours Lennon spends driving, $d$, and the number of hours he spends hiking, $h$, while he is at the park?
A) $1.5 h+20 d>60$

$$
h+d \leq 6
$$

B) $1.5 h+20 d>60$

$$
h+d \geq 6
$$

C) $1.5 h+20 d<60$

$$
h+d \geq 360
$$

D) $20 h+1.5 d>6$

$$
h+d \leq 60
$$

19
In a certain sporting goods manufacturing company, a quality control expert tests a randomly selected group of 1,000 tennis balls in order to determine how many contain defects. If this quality control expert discovered that 13 of the randomly selected tennis balls were defective, which of the following inferences would be most supported?
A) $98.7 \%$ of the company's tennis balls are defective
B) $98.7 \%$ of the company's tennis balls are not defective
C) $9.87 \%$ of the company's tennis balls are defective
D) $9.87 \%$ of the company's tennis balls are not defective

## 20

If $-\frac{20}{7}<-3 z+6<-\frac{11}{5}$, what is the greatest possible integer value of $9 z-18$ ?
A) 6
B) 7
C) 8
D) 9

$$
\begin{aligned}
-24-8 j & =12 k \\
3+\frac{5}{3} k & =-\frac{7}{6} j
\end{aligned}
$$

Which of the following ordered pairs $(j, k)$ is the solution to the system of equations above?
A) $(6,-6)$
B) $(3,0)$
C) $(0,2)$
D) $(-4,1)$

4

## 22

| $\begin{array}{c}\text { United States Investment in } \\ \text { Alternative Energy Sources }\end{array}$ |  |
| :--- | :---: |
|  | $\begin{array}{c}\text { Actual } \\ \text { 2007 Investment }\end{array}$ |
| Biofuels | 0.31 |
| Projected |  |
| 2017 Investment |  |$]$

The table above shows the relative investment in alternative energy sources in the United States by type. One column shows the relative investment in 2007 of $\$ 75$ million total invested in alternative energy. The other column shows the projected relative investment in 2017 given current trends. The total projected investment in alternative energy in 2017 is $\$ 254$ million. Suppose that a new source of alternative energy, Cold Fusion, is perfected. It is projected that by 2017 that $\$ 57$ million will be invested in Cold Fusion in the United States, without any corresponding reduction in investment for any other form of alternative energy. What portion of the total investment of alternative energy in the United States will be spent on biofuels?
A) 0.18
B) 0.22
C) 0.28
D) 0.34

23

$$
\begin{aligned}
(x-2)^{2}+y^{2} & =36 \\
y & =-x+2
\end{aligned}
$$

The equations above represent a circle and a line that intersects the circle across its diameter. What is the point of intersection of the two equations that lies in quadrant II?
A) $(-3 \sqrt{2}, 3 \sqrt{2})$
B) $(-4,2)$
C) $(2+\sqrt{3}, 2)$
D) $(2-3 \sqrt{2}, 3 \sqrt{2})$

24

The graph of $f(x)$ is shown above in the $x y$-plane. The points $(0,3),(5 b, b)$, and $(10 b,-b)$ are on the line described by $f(x)$. If $b$ is a positive constant, what are the coordinates of point $C$ ?
A) $(5,1)$
B) $(10,-1)$
C) $(15,-0.5)$
D) $(20,-2)$

## 25

Melanie puts $\$ 1,100$ in an investment account that she expects will make $5 \%$ interest for each threemonth period. However, after a year she realizes she was wrong about the interest rate and she has $\$ 50$ less than she expected. Assuming the interest rate the account earns is constant, which of the following equations expresses the total amount of money, $x$, she will have after $t$ years using the actual rate?
A) $x=1,100(1.04)^{4 t}$
B) $x=1,100(1.05)^{4 t-50}$
C) $x=1,100(1.04)^{1 / 3}$
D) $x=1,100(1.035)^{4 t}$

26

If the radius of the circle above is $x, \angle A O B=120^{\circ}$, and $O$ is the center of the circle, what is the length of chord $A B$ in terms of $x$ ?
A) $\sqrt{2} x$
B) $\sqrt{3} x$
C) $\frac{x}{\sqrt{2}}$
D) $\frac{x}{\sqrt{3}}$

27
Students in a physics class are studying how the angle at which a projectile is launched on level ground affects the projectile's hang time and horizontal range. Hang time can be calculated using the formula $t=\frac{2 v \cdot \sin (\theta)}{g}$, where $t$ is the hang time in seconds, $v$ is the initial launch velocity, $\theta$ is the projectile angle with respect to level ground, and $g$ is the acceleration due to gravity, defined as $9.8 \mathrm{~m} / \mathrm{s}^{2}$. Horizontal range can be calculated using the formula $R=\frac{v^{2} \sin (2 \theta)}{g}$, where $R$ is the distance the projectile travels from the launch site, in feet. Which of the following gives the value of $v$, in terms of $R, t$, and $\theta$ ?
A) $v=\frac{t \sin (\theta)}{2 R \sin (\theta)}$
B) $v=\frac{2 t \sin (\theta)}{R \sin (\theta)}$
C) $v=\frac{2 R \sin (\theta)}{t \sin (2 \theta)}$
D) $v=\frac{2 R \sin (2 \theta)}{t \sin (\theta)}$

28
If $\left(i^{413}\right)\left(i^{x}\right)=1$, then what is one possible value of $x$ ?
A) 0
B) 1
C) 2
D) 3

The function $g$ is defined by $g(x)=2 x^{2}-d x-6$, where $d$ is a constant. If one of the zeros of $g$ is 6 , what is the value of the other zero of $g$ ?
A) 2
B) $\frac{1}{2}$
C) $-\frac{1}{2}$
D) -2

30
The flu shot for a flu season is created from four strains of the flu virus, named Strain A, B, C, and D, respectively. Medical researchers use the following data to determine the effectiveness of the vaccine over the flu season. Table 1 shows the effectiveness of the vaccine against each of these strains individually. The graph below the table shows the prevalence of each of these strains during each month of the flu season, represented as a percentage of the overall cases of flu that month.

Table 1

| Strain | Effectiveness |
| :--- | :--- |
| A | $35 \%$ |
| B | $13 \%$ |
| C | $76 \%$ |
| D | $68 \%$ |

For the strain against which the flu shot was the most effective, approximately how effective was the shot overall when that strain was least prevalent?
A) $13 \%$
B) $20 \%$
C) $27 \%$
D) $48 \%$

31
If $9>3 v-3$, what is the greatest possible integer value of $v$ ?

32
In the expression $\frac{\frac{6}{5}}{\frac{12}{2 y}-\frac{5}{y}}=1$, what is the value of $y$ ?

33
During a presidential election, a high school held its own mock election. Students had the option to vote for Candidate A, Candidate B, or several other candidates. They could also choose to spoil their ballot. The table below displays a summary of the election results.

|  | Candidate <br> A | Candidate <br> B | Other | Total |
| :--- | :--- | :--- | :--- | :--- |
| $10^{\text {th }}$ grade | 0.32 | 0.58 | 0.10 | 1.00 |
| $11^{\text {th }}$ grade | 0.50 | 0.42 | 0.08 | 1.00 |
| $12^{\text {th }}$ grade | 0.63 | 0.32 | 0.05 | 1.00 |
| Total | 0.48 | 0.44 | 0.08 | 1.00 |

614 students voted for Candidate A. Approximately how many students attend the school?

34

If $\tan \theta=\frac{12}{5}$, then $\cos \theta=$

Marcellus is traveling abroad in Ghana and using traveler's checks, which he has acquired from Easy Traveler's Savings Bank. Easy Traveler's Savings Bank charges a 7\% fee on traveler's checks, which can then be used like cash at any location overseas at the same exchange rate, and any change will then be returned to Marcellus in local currency. For this trip, Marcellus bought a 651 Cedi traveler's check and paid a fee of 32.30 USD (United States dollars) for the check.

While in Ghana, Marcellus finds Leon's Pawnshop and Barter, which offers store credit for Marcellus's briefcase equal to its value in Cedis. If Marcellus's briefcase is worth 5,000 USD at the same exchange rate at which he bought his traveler's check, then how much store credit, to the closest Cedi, will Marcellus receive for the briefcase?

36
A square is inscribed in a circle. The area of the square is what percent of the area of the circle? (Disregard the percent symbol when gridding your answer.)

## Section 3: Math (No Calculator)

1. A The vertex form of a parabola is $y=a(x-h)^{2}+k$, where $(h, k)$ denotes the vertex. Plug in the point $(3,-3)$ into the vertex form to get $y=a(x-3)^{2}-3$. The correct answer is (A).
2. C You can plug in to make sense of this equation. Say that $x=\$ 100$. The amount of the keg would then be $\$ 107+\$ 17$. The $\$ 17$ must be the untaxed deposit since it is a flat fee rather than percentage based. Therefore, the tax is \$7, which is $7 \%$ of the original $\$ 100$ base price. The answer is (C).
3. D Whenever there are variables in the question, plug in. Be sure to plug in a number that is divisible by 3 . Let $d=300 . \frac{1}{3}$ of the original amount of $\$ 300$ is
$\$ 100$, and that is deducted by the company, leaving Syed with $\$ 200$. Now, subtract the wire transfer fee to get $\$ 200-\$ 30=\$ 170$, which is the target number. Plug in 300 for $d$ in the answers to see which answer is equal to the target number of 170 . In (A), $\frac{1}{3}(300)-30=70$. This is not the target number, so eliminate $(A)$. Likewise in $(B), \frac{1}{3}(300-30)=90$, and in $(C), \frac{2}{3}(300-30)=$ 180. Neither of these is the target number, so eliminate (B) and (C). In (D), $\frac{2}{3}$ (300) $-30=170$, which is the target number. The correct answer is (D).
4. C All of the answers are written in the slope-intercept form $y=m x+b$, where $b$ is the $y$-intercept and $x$ and $y$ are points on the line. Eliminate (D) because the $y$-intercept in that equation is 2 . For the remaining answer choices, plug in the $x$ - and $y$-values to determine which equation works. If $x=1$ and $y=6$, (A) becomes $6=\frac{1}{2}(1)+4$. Solve both sides of the equation to get $6=4 \frac{1}{2}$. Eliminate (A). Choice (B) becomes $6=1+4$, so eliminate (B). Choice (C) becomes $6=$ $2(1)+4$, or $6=6$. Therefore, the correct answer is (C).
5. C Whenever there are variables in the question and the answer choices, think Plugging In. If 2 purchases were made, then $p=2$, and the number of bonus points can be calculated as $4(2)+7=8+7=15$. If the number of purchases were then increased by 3 , the new $p$ equals 5 and the number of bonus points can be calculated as $4(5)+7=27$. The bonus points increased by $27-15=12$. Therefore, the correct answer is (C).
6. B This is a good Plug In the Answers problem. Start with (B) and plug in 2 for $x$ and 3 for $r$ in the equation to get $V=24 \pi+2\left(\frac{4}{3} \pi 3^{3}\right)$, which is equal to the target amount of $96 \pi$, so (B) is correct.
7. C Whenever there are variables in the question and in the answers, think Plugging In. Let $c=30$. Therefore, $b=2+\frac{1}{3}(30)=2+10=12$. Plug 12 in for $b$
in the answers to see which answer equals the target number of 30 . Choice (A) becomes $\frac{12-2}{3}=\frac{10}{3}=3 . \overline{3}$. Eliminate (A), since it does not equal the target number. Choice (B) becomes $\frac{12+2}{3}=\frac{14}{3}=4 . \overline{6}$. Eliminate (B). Choice (C) becomes $3(12-2)=3(10)=30$. Keep (C), but check (D) just in case it also works. Choice (D) becomes $3(12-6)=3(6)=18$. Eliminate (D). The correct answer is (C).
8. D Treat this question as a translation problem. According to the question, $R(h)=$ four rotations per second less than three times the square of the height of the liquid. The height of the liquid is represented by $h$. Therefore, three times the square of the height of the liquid $=3 h^{2}$. Four less than this amount is $3 h^{2}-4$. Since the original speed was 1,000 , subtract this value from 1,000 to get the current rate of rotation. The correct answer is (D).
9. B Start with the easier equation and use Process of Elimination. The easier equation is related to the total number of ounces, $c+b$, in the tube. According to the question, the tube has 24 ounces, so $c+b=24$. Eliminate (A), since it does not include this equation. The other equation in the set is related to the amount of active ingredients. According to the question, $c$ includes $0.25 \%$ of sodium fluoride and $b$ contains $0.30 \%$ triclosan. $0.25 \%=0.0025$ and $0.30 \%=$ 0.003 . Therefore, in the correct equation, $c$ should be associated with 0.0025 and $b$ should be associated with 0.003 . Eliminate (C) and (D) because both of these equations get the percentages wrong. The correct answer is (B).
10. C Whenever the question includes variables and the answer choices are numbers, think Plugging In the Answers. In (A), $d=-4$, and the equation becomes $\frac{2(-4)^{2}-(-4)-10}{(-4)^{2}+7(-4)+10}=\frac{(-4)^{2}-4(-4)+3}{(-4)^{2}+2(-4)-15}$. Solve both sides of the equation to get $\frac{2(16)+4-10}{16-28+10}=\frac{16+16+3}{16-8-15}$, or $\frac{26}{-2}=\frac{35}{-7}$. Reduce both fractions to get $-13=-5$. This is not true, so eliminate (A). In (B), $d=2$, and
the equation becomes $\frac{2(2)^{2}-2-10}{2^{2}+7(2)+10}=\frac{2^{2}-4(2)+3}{2^{2}+2(2)-15}$. Solve both sides of the equation to get $\frac{2(4)-2-10}{4+14+10}=\frac{4-8+3}{4+4-15}$, or $\frac{-4}{28}=\frac{-1}{-7}$. Reduce both fractions to get $\frac{-1}{7}=\frac{1}{7}$. Eliminate (B). In (C), $d=4$ and the equation becomes $\frac{2(4)^{2}-4-10}{4^{2}+7(4)+10}=\frac{4^{2}-4(4)+3}{4^{2}+2(4)-15}$. Solve both sides of the equation to get $\frac{2(16)-4-10}{16+28+10}=\frac{16-16+3}{16+8-15}$, or $\frac{18}{54}=\frac{3}{9}$. Reduce both fractions to get $\frac{1}{3}=\frac{1}{3}$.
The correct answer is (C).
11. D All the answer choices are equal to 4 (which is $r^{2}$, making $r=2$ ), so you need to focus on where the center of the circle lies. If the circle is tangent to both the $x$ axis (which is equivalent to the line $y=0$ ) and the line $x=4$, then the center must be 2 units from $y=0$ and 2 units from $x=4$. Choices (A) and (B) both have centers with an $x$ value of -2 (remember the standard form of the circle equation is $(x-h)^{2}+(y-k)^{2}=r^{2}$, where $(h, k)$ is the center and $r$ is the radius), which is 6 units from $x=4$. Eliminate (A) and (B). Choice (C) has a center at $(2,-4)$. The $x$ value is 2 units from $x=4$; however, the $y$ value is 4 units from $y=0$. Eliminate (C) and choose (D).
12. B According to the question, Reactant A does not react unless B gets to a certain concentration. Therefore, the correct answer will have an initial flat line for A while the line for $B$ is rising. Only graph (B) shows this initial relationship. Therefore, the correct answer is (B).
13. A All of the answers have the same lines graphed, so this question is really about the shading. Plugging In is probably the easiest way to approach this problem. Start with $(0, o)$ because this is an easy value to check. This works in all three equations since $0 \leq 8,-3 \leq 0$, and $1 \geq 0$. Therefore, this value needs to be shaded as a possible answer. Eliminate (B), (C), and (D) because they do not include this point. The correct answer is (A).
14. C First draw lines $A C$ and $B D$. Now, since tangent is opposite over adjacent, $\frac{B A}{B C}=$
$\frac{4}{9}$. Also, $B A \times B C=324$. Using these two equations as a system of equations can now help get what is needed. Rearrange the first equation by multiplying both sides by $B C$ to get $B A=\frac{4}{9} B C$. Now substitute $\frac{4}{9} B C$ into the first equation to get $\frac{4}{9} B C(B C)=324$; this simplifies to $\frac{4}{9} B C^{2}=324$. Multiply both sides by $\left(\frac{9}{4}\right)$ to get $B C^{2}=729$, and then take the square root to get $B C=27$. Since the diagonal has to be larger than any of the sides, (A) and (B) are out. Choice (D) can also be eliminated because our previous calculations can get the length of $D C$, which is used in the Pythagorean theorem to get $B D$. Therefore, the correct answer is (C).
15. D Whenever there are variables in the question and answers, think Plugging In.

$$
\begin{aligned}
& \text { I f } m \text { = } 2, \quad \text { the } \quad \text { expression } \quad \text { becomes } \\
& \frac{2(2)+6}{4} \times \frac{6(2)-36}{3(2)+9}=\frac{4+6}{4} \times \frac{12-36}{6+9}=\frac{-24}{15}=\frac{10}{4} \times \frac{-240}{60}=-4 . \text { Plug } 2 \text { in }
\end{aligned}
$$

for $m$ in the answers to see which answer equals the target number of -4 . Choice (A) becomes $\frac{12(2)^{2}-216}{12(2)+36}=\frac{12(4)-216}{24+36}=\frac{48-216}{60}=\frac{-168}{60}=-2.8$. This does not match the target number, so eliminate (A). Choice (B) becomes $\frac{8(2)-30}{3(2)+13}=\frac{16-30}{6+13}=\frac{-14}{19}$. Eliminate (B). Choice (C) becomes $\frac{2-6}{4}=\frac{-4}{4}=$ -1. Eliminate (C). Choice (D) becomes $m-6=2-6=-4$. The correct answer is (D).

## 16. <br> 1.5

or $\frac{3}{2}$
Plug the given values into the equation: $18=(3)(4)(x)$. Multiply the right side of the equation and you find that $18=12 x$. Divide both sides by 12 and you find that $x=\frac{18}{12}$. Both 18 and 12 are divisible by 6 , so this fraction reduces to $\frac{3}{2}$.
17. 53 Jean charges $5.50 \times 2=\$ 11$ per hour for babysitting. Therefore, her entire earnings for three hours can be calculated as $(3 \times 11)+20=53$. The correct answer is 53 .
18. 10 To solve the problem without a graphing calculator, set the two equations equal to each other: $-x^{2}+5 x+6=x+12$. Multiply the entire equation by 2 to get $-2 x^{2}+10 x+12=-x+24$. Rewrite the equation so that it equals 0 , so it becomes $-2 x^{2}+11 x-12=0$. Multiply the entire equation by -1 to get $2 x^{2}-$ $11 x+12=0$. Factor the quadratic to get $(2 x-3)(x-4)=0$. Solve for the two possible values of $x$ : If $2 x-3=0$, then $x=\frac{3}{2}$, and if $x-4=0$, then $x=4$. Because the slope of the line is negative, the $x$-value of the point that is farthest to the right along the $x$-axis must also be closer to the $x$-axis. Plug 4 in for $x$ in the second equation to get $y=-\frac{1}{2}(4)+12=-2+12=10$. The correct answer is 10 .

## 19. $\frac{11}{3}$

or $\mathbf{3 . 6 6}$ or
3.67

Whenever there are two equations with the same two variables, they can be solved simultaneously by adding or subtracting them. Take the second
equation and rewrite it so that the variables are on the left side of the equation: $17 r+22 v=63$. Stack the equations and add them together.

$$
\begin{aligned}
& 13 r+8 v=47 \\
& 17 r+22 v=63 \\
& \hline 30 r+30 v=110
\end{aligned}
$$

Divide the entire equation by 30 to get $r+v=\frac{110}{30}$. This is too big to grid in, so reduce it to $\frac{11}{3}$.
20. 2 The area of the current plot is $4 \times 6=24$ square feet, so the new plot will be 24 $\times 2=48$ square feet. According to the question, $x$ feet will be added to each side to obtain the new area of 48 feet. Since the length is only 2 feet more than the width, you need two factors of 48 that differ by 2 . You may recognize these factors are 6 and 8 . So the increase was 2 feet in each direction. Alternatively, you could write a quadratic: $(4+x)(6+x)=48$. Expand the right side of the equation to get $x^{2}+10 x+24=48$. Set the equation to o by subtracting 48 from both sides to get $x^{2}+10 x-24=0$. Factor the equation to get $(x+12)(x-$ $2)=0$. Therefore, $x=-12$ or $x=2$. Since lengths can never be negative the only possible value is $x=2$. The correct answer is 2 .

## Section 4: Math (Calculator)

1. C Use Process of Elimination to answer this question. According to the question, $P$ represents the population, so the outcome of the entire equation has something to do with the population. Therefore, eliminate both (A) and (B) because 1.0635 can't represent the population if $P$ does. In the equation given, the only operations are multiplication and addition, which means that over time the population would increase. Therefore, eliminate (D). The correct answer is (C).
2. B To solve the quadratic equation, first set the equation equal to 0 . The equation becomes $x^{2}+12 x-64=0$. Next, factor the equation to get $(x+16)(x-4)=0$. Therefore, the two possible solutions for the quadratic equation are $x+16=0$ and $x-4=0$, so $x=-16$ or 4 . Since the question states that $x>0, x=4$ is the
only possible solution. Another way to approach this question is to plug in the answers. Start with (B), $x=4$. Plug 4 into the equation to get $4^{2}+12(4)=64$. Solve the left side of the equation to get $16+48=64$, or $64=64$. Since this is a true statement, the correct answer is (B).
3. A To figure out the total number of shelving units Sai could use, find the total available wall space and divide by the length of the units. The total amount of wall space can be calculated as $119-21$. Because the length of each unit is 7 feet, the maximum number of units Sai could put up can be calculated as $\frac{119-21}{7}$. Because this is the maximum number of units Sai could put up, $r$ has to be less than or equal to this number. Therefore, the correct answer is (A).
4. Weight is shown on the vertical axis of the graph, given in ounces. Make your own mark indicating 5.75 on this axis; then draw a horizontal line from that mark to the line of best fit. Once you hit it, draw a vertical line straight down to the horizontal axis. It should hit between 75 and 80 days, slightly closer to the mark for 75 . This makes (C) the credited response. Draw your lines carefully, using your answer sheet as a straightedge if necessary.
5. C Whenever the question includes variables, plug in. If $s=2$, the shirts cost $2(\$ 24.50)=\$ 49$. The tax on the shirts is $0.07(\$ 49)=\$ 3.43$. So, the shirts with tax and the $\$ 6$ shipping fee cost $\$ 49+\$ 3.43+\$ 6=\$ 58.43$. Plug in 2 for $s$ in the answers to see which answer equals the target number of $\$ 58.43$. In (A), $0.07[24 \cdot 50(2)+6]=3.85$. This is not the target number, so eliminate (A). In (B), $1.07(24.50+6)(2)=65.25$. Again, this is not the target number, so eliminate (B). In (C), $1.07[24.50(2)]+6=58.43$. This is the target number, so keep it, but be sure to check the remaining answer choice. In (D), 1.07(24.50 + 2) $+6=34.355$, which is not the target number. Therefore, the correct answer is (C).
6. B The question states that after 6 weeks the plant is 54 centimeters tall. Therefore, when $w=6, h(w)=54$. Plug in 6 for $w$ in the answers to see in which answer $h(w)$ equals the target number of 54 . In (A) $h(w)=6(6)=36$. Eliminate (A). In (B), $h(w)=9(6)=54$. The correct answer is (B).
7. D Because the operation between the parentheses is addition, the parentheses can be removed, and the resulting expression becomes $12 x^{2}+4 x+5 y+3 x^{2}-$ $2 x+3 y$. Reorder the terms so that like terms are next to each other: $12 x^{2}+3 x^{2}$ $+4 x-2 x+5 y+3 y$. Combine like terms to get $15 x^{2}+2 x+8 y$. The correct answer is (D).
8. D You do not know how the survey is conducted, nor do you know how many veterinarians were surveyed (it may be the case that only 8 were surveyed). Therefore, you cannot infer that the survey accurately measures all veterinarians' beliefs about Royal Rat Rations. Choice (A) is not supported. First, you do not know what veterinarians believe in general, and second veterinarians may be recommending Royal Rat Rations for a reason other than its nutrition. Choice (B) is similarly not supported. Besides not knowing veterinarians' beliefs, this choice assumes that no other rat food is acceptable. Choice (C) is not supported because you do not know the sample size of the survey, nor is there any indication that there is only one veterinarian who does not recommend Royal Rat Rations. Choice (D) is the credited response. You know the opinions only of the veterinarians surveyed by Royal Rat Rations.
9. D Use a calculator to translate the fractions into decimals. $\frac{1}{2} t+4=\frac{3}{4} t-5$ becomes $0.5 t+4=0.75 t-5$. Subtract $0.5 t$ from both sides to get $4=0.25 t-5$, and then add 5 to both sides. This results in $9=0.25 t$. Use a calculator to divide! $t=36$; therefore, the correct answer is (D).
10. C Taking the two dogs together, Everett has $35+55=90$ pounds of dog. Set up the following proportion to determine the lowest amount of water the dogs need per day: $\frac{8.5 \text { ounces }}{10 \mathrm{lbs}}=\frac{x}{90 \mathrm{lbs}}$. Cross-multiply to get $10 x=765$, so $x=76.5$. Multiply by 7 days to get the weekly amount of water the dogs need: $76.5 \times 7=$ 535.5 ounces, or approximately 536 ounces. Only (C) includes 536 as the lowend amount. Therefore, the correct answer is (C).
11. A In order to answer this question, you need to deal with the ratio as well as the unit conversion. For the large batch of dry rub, Priya's friend is planning to use

91 ounces of chili powder. Since the paprika and the chili powder must be used in a ratio of 4 to 7 , you can set up a proportion to determine how much paprika is needed: $\frac{4}{7}=\frac{x}{91}$. Cross-multiply and solve for $x$ to determine that $x$ (i.e., paprika) $=52$ ounces. So you have 52 ounces of paprika and 91 ounces of chili powder for a total of 143 ounces. Multiply that by your conversion number, 28.3 , to determine that this is equivalent to $4,046.9$ grams, which is closest to (A).
12. D Whenever there are variables in the problem and in the answer choices, plug in. If $w=20$, then Luciano's cup has $20-2=18$ ounces at the end of day 1 . At the end of 7 days, Luciano's cup would have $18-8=10$ ounces. After 11 days, Luciano's cup would hold $10-5=5$ ounces. Plug in 20 for $w$ in the answer choices to see which answer is equal to the target number of 5 . Choice (A) becomes $\frac{20-2}{8}=\frac{18}{8}=2.25$. This does not match the target number of 5 , so eliminate (A). Choice (B) becomes $\frac{20-2}{2}-10=\frac{18}{2}-10=9-10=-1$. Eliminate (B). Choice (C) becomes $\left(\frac{1}{2}\right)^{2}(20)-10=10-10=0$. Eliminate (C). Choice (D) becomes $\frac{20-10}{2}=\frac{10}{2}=5$. This matches the target number; therefore, the correct answer is (D).
13. B According to the line of best fit, in 1995 there were 20 coyotes in the park. In 2000, there were 140 coyotes in the park. This is an increase of 120 coyotes over a period of 5 years, so $\frac{120}{5}=$ an average increase of 24 coyotes per year, which is (B).
14. D The median number of coyotes in the park in 1995 was 20 , and the median number of coyotes in the park in 1996 was 60 . (Be careful to RTFQ: the question wants median, NOT line of best fit!) In order to calculate the percent
increase, it is necessary to use the percent change formula: $\frac{\text { difference }}{\text { original }} \times 100$. The calculation here will be $\frac{60-20}{20} \times 100=\frac{40}{20} \times 100=2 \times 100=200 \%$, which is (D).
15. A Start with the easier equation and use Process of Elimination. The easier equation is related to the total number of shirts and pants, $s+p$, sold on a regular day. The question states that on a regular day Bailey's sells $\frac{2}{3}$ the number of pants and shirts sold during a sale. $\frac{2}{3}(60)=40$. Therefore, one of the equations in the correct answer should be $s+p=40$. Eliminate (C) and (D) since neither of these answers include this equation. The other equation is related to the money Bailey's earns on a regular day. According to the question, Bailey's earns a total of $\$ 1,875$ on a regular day, so the equation must equal $\$ 1,875$. Eliminate (B) because the total in the money equation is incorrect. The correct answer is (A).
16. C There are a few different ways to approach this question. In any approach, the best first step is to figure out how much income Bryan earned during the twoweek period without the commission. Since he worked an average of 35 hours per week for two weeks, he worked a total of 70 hours. At a rate of $\$ 10.00$ per hour base pay, this would add up to $\$ 700.00(70 \times 10=700)$. Since Bryan's earnings were actually $\$ 850.00$, that means he must have earned $\$ 150.00$ of commission $(850-700=150)$. At this point, you can calculate the percent commission algebraically or simply work backwards from the answers. Algebraically, you know that $\$ 150.00$ is equal to a certain percent of $\$ 5,000.00$ in sales, which can be represented as follows: $150=\frac{x}{100}(5,000)$. Solve for $x$, and you get 3 , which is (C). If instead you wish to work backwards from the
answers, you can take the answers and calculate what $1 \%, 2 \%$, etc. of $\$ 5,000.00$ would be, and then add that back to $\$ 700.00$ to see which choice matches your target of $\$ 850.00$ : (C).
17. Cross-multiply to get $3(C+x)=(x-3)(x+8)$. Expand the right side of the equation to get $3(C+x)=x^{2}+5 x-24$. Distribute the 3 to get $3 C+3 x=x^{2}+$ $5 x-24$. Subtract $3 x$ from both sides of the equation to get $3 C=x^{2}+2 x-24$. Factor the right side of the equation to get $3 C=(x+6)(x-4)$. Divide both sides by 3 to get $C=\frac{(x+6)(x-4)}{3}=\frac{1}{3}(x+6)(x-4)$. The correct answer is (C).
18. A Start with the easiest piece of information first, and use Process of Elimination. Given that $h$ is the number of hours spent hiking and $d$ is the number of hours driving, the total number of hours Lennon spends in the park can be calculated as $h+d$. The question states that Lennon has up to 6 hours to spend in the park-"up to" means $\leq$. So, $h+d \leq 6$. Eliminate (B), (C), and (D). The correct answer is (A).
19. B The quality control expert discovered that 13 out of 1,000 randomly selected tennis balls were defective. $\frac{13}{1000}=0.013$, which is equivalent to $1.3 \%$. This means that $100-1.3=98.7 \%$ of tennis balls tested were not defective, and this data most supports answer (B).
20. C When solving inequalities, the natural impulse is to isolate the variable. In this case, though, look at what the question is asking. The question doesn't want you to find just the the value of $z$ but rather the value of $9 z-18$. To get from the value of $-3 z+6$ given in the inequality to this new value, the original inequality must be multiplied by -3 . Just multiply the entire inequality by this value, making sure to flip the inequality signs when multiplying by a negative number. The equation becomes $-3\left(-\frac{20}{7}\right)>-3(-3 z+6)>-3\left(-\frac{11}{5}\right)$ or $\frac{60}{7}>$
$9 z-18>\frac{33}{5}$.The question asks for the greatest possible integer value, so focus on the high end of the given values. The value at that end, $\frac{60}{7}$, equals 8.57 , so the greatest integer less than that is 8 . The answer is (C).
21. A Whenever there are variables in the question and numbers in the answer choices, think Plugging In the Answers. In (A),$j=6$, and $k=-6$. Plug these two values into the first equation to get $-24-8(6)=12(-6)$. Solve for both sides of the equation to get $-24-48=-72$, or $-72=-72$. Therefore, the values work for the first equation. Plug the values into the second equation to get $3+\frac{5}{3}(-6)=-\frac{7}{6}(6)$. Solve both sides of the equation to get $3+(-10)=-7$, or $-7=-7$. Since the values given in (A) work in both equations, the correct answer is (A).
22. Cirst, you know the new proportion must be less than the current 0.34 for biofuels (because the total amount spent on alternative energy is increasing, but the amount spent on biofuels is remaining the same), so you can eliminate (D). Next, determine the amount that will be spent on biofuels in 2017 by multiplying 0.34 by the total of $\$ 254$ million: $0.34 \times 254=\$ 86.36$ million. Because 57 million new dollars will be spent on alternative energy, the new total will be $254+57=\$ 311$ million. Divide $\$ 86.36$ million by $\$ 311$ million to get the new proportion: $\frac{86.38}{311}=0.28$, which is (C).
23. D In quadrant II, the $x$-coordinate is negative, and the $y$-coordinate is positive. Therefore, eliminate (C). Whenever the question includes variables and the answers are numbers, think Plugging In the Answers. Of the remaining answers, (B) is easiest to work with. In (B), the $x$-value is -4 and the $y$-value is 2. Plug these values into the second equation to get $-4=-2+2$. Given that this is not a true statement, eliminate (B). Try the values in (A) in the second equation to get $3 \sqrt{2}=-(-3 \sqrt{2})+2$. This is also not true, so the correct answer
is (D).
24. B Right away, (A) can be eliminated, since point $C$ has a negative $y$-coordinate. Given any two points, the slope of the line can be determined using the equation $\frac{y_{2}-y_{1}}{x_{2}-x_{1}}$. Use this formula to find the value of $b$ by setting the slope of $\overline{A B}$ equal to the slope of $\overline{B C}$. Use points $(0,3)$ and $(5 b, b)$ in the left side of the equation and points $(5 b, b)$ and $(10 b,-b)$ in the right side of the equation to get $\frac{3-b}{0-5 b}=\frac{-b-b}{10 b-5 b}$. Simplify both sides of the equation to get $\frac{3-b}{-5 b}=\frac{-2 b}{5 b}$, or $\frac{3-b}{-5 b}=\frac{-2}{5}$. Cross-multiply to get $5(3-b)=10 b$. Divide both sides by 5 get $3-b=2 b$, then $3=3 b$, and finally $b=1$. Plug in $b=1$ for point C to get [10(1), - (1)], or (10, -1). Therefore, the correct answer is (B).
25. A The formula for compound interest is $A=P(1+r)^{t}$, where $P$ is the starting principle, $r$ is the rate expressed as a decimal, and $t$ is the number of times the interest is compounded. Melanie received less than $5 \%$ interest, so you can eliminate (B) because $1.05=1+0.05$, indicating she was receiving $5 \%$ interest. You can also eliminate (C) because over the course of a year the interest is compounded 4 times, not $\frac{1}{3}$ of a time. Because Melanie invested $\$ 1,100$ at what she thought was $5 \%$ compounded 4 times ( 12 months in a year $\div 3$ months per period), she expected $1,100(1+0.05)^{4}=\$ 1,337.06$ after a year. Instead, she has $1,337.06-50=\$ 1,287.06$ after one year. Because $t$ is in years in the answer choices, make $t=1$ in (A) and (D) and eliminate any choice which does not equal $1,287.06$. Only (A) works.
26. B You can start by Plugging In a value for $x$; try $x=4$. Because angle $A O B$ is $120^{\circ}$ and the triangle is isosceles, angles $A$ and $B$ are each $30^{\circ}$. Cut triangle $A O B$ in half to make two 30-60-90 triangles with a hypotenuse of 4 and sides of 2 and $2 \sqrt{3}$. The side with length $2 \sqrt{3}$ lies on chord $A B$. Double it to get the total
length: $4 \sqrt{3}$ or just $\sqrt{3} x$, which is (B) when you put $x=4$ into the answer choices.
27. C Whenever there are variables in the question and in the answers, think Plugging In. The question states the value of $g$, but it is a constant and a weird one at that. Pick numbers for all the variables that will make the math more straightforward. If $v=4$ and $g=2$, then $t=\frac{2(4) \cdot \sin (\theta)}{2}=\frac{8 \cdot \sin (\theta)}{2}=4 \cdot \sin (\theta)$, and $R=\frac{4^{2} \cdot \sin (2 \theta)}{2}=\frac{16 \cdot \sin (2 \theta)}{2}=8 \cdot \sin (2 \theta)$. Plug these values into the answers to see which equation works. Choice (A) becomes $4=\frac{4 \cdot \sin (\theta) \cdot \sin (\theta)}{2[8 \sin (2 \theta) \sin (\theta)]}$. Simplify the right side of the equation to get $4=\frac{4 \cdot \sin (\theta) \cdot \sin (\theta)}{16 \sin (2 \theta) \sin (\theta)}$, or $4=\frac{\sin (\theta)}{4 \sin (2 \theta)}$. This will not simplify further, so eliminate (A). Choice (B) becomes $4=\frac{2[4 \sin (\theta)] \sin (\theta)}{8 \sin (2 \theta)(\sin (\theta))}$. Simplify the right side of the equation to get $4=\frac{8 \sin (\theta)(\sin (\theta))}{8 \sin (2 \theta)(\sin (\theta))}$ or $4=\frac{\sin (\theta)}{\sin (2 \theta)}$. Eliminate (B). Choice (C) becomes $4=\frac{2[8 \sin (2 \theta)] \sin (\theta)}{(4 \sin (2 \theta))(\sin (2 \theta))}$. Distribute the 2 to get $4=\frac{16 \sin (2 \theta) \sin (\theta)}{(4 \sin (\theta))(\sin (2 \theta))}$. Reduce the equation to get or $4=\frac{16}{4}$ or $4=4$. The correct answer is (C).
28. D $i^{a}=1$ when $a$ is a multiple of 4 . Using your exponents rules, $413+x$ must also be a multiple of 4 . Plug in the answers and look for what makes $413+x$ a multiple of 4 . Only (D) works.
29. C The zero of $g$ is the value of the variable, in this case $x$, when the equation is set to $o$. This is also called the root or solution of an equation. Set the equation
to o to get $0=2 x^{2}-d x-6$. Plug 6 in for $x$ to get $0=2\left(6^{2}\right)-d(6)-6$. Simplify the equation to get $0=72-6 d-6$, or $0=66-6 d$. Solve for $d$ to get $-66=$ $-6 d$, so $11=d$. Plug 11 in for $d$ and set the quadratic to 0 to get $0=2 x^{2}-11 x-$ 6. Factor the equation to get $0=(x-6)(2 x+1)$. The other zero of the equation is when $2 x+1=0$. Solve for $x$ to get $2 x=-1$, or $x=\frac{-1}{2}$. The correct answer is (C).
30. D The flu shot is most effective against Strain C, which is least prevalent in March. To determine the overall efficacy of the flu shot at this time, multiply the prevalence of each strain of flu by the efficacy of the flu shot against that strain, and then add those products to get a weighted average of the efficacy of the shot: $(0.23 \times 0.35)+(0.25 \times 0.13)+(0.13 \times 0.76)+(0.39 \times 0.68)=0.477$ $=47.7 \%$, which is closest to (D).
31. 3 Solve the equation for $v$. Take $9>3 v-3$ and add 3 to both sides to get $12>3 v$. Now divide both sides by 3 to find that $4>v$. Therefore, the largest integer that $v$ could be is 3 . Grid in 3 .
32. $\frac{5}{6}$ or
0.83

Start by multiplying the second fraction in the denominator of the equation by

$$
\frac{2}{2} \text { to get } \frac{\frac{6}{5}}{\frac{12}{2 y}-\frac{10}{2 y}}=1 \text {. Combine the fractions in the denominator to get } \frac{\frac{6}{5}}{\frac{2}{2 y}}=1
$$ . Reduce the fraction in the denominator to get $\frac{\overline{5}}{\frac{1}{y}}=1$. Dividing by a number is the same as multiplying by its reciprocal, so the equation becomes $\frac{6}{5} \times y=1$. Multiply both side of the equation by $\frac{5}{6}$ to get $y=\frac{5}{6}$. The correct answer is $\frac{5}{6}$.

33. 1,279 614 students voting for Candidate A represents 0.48 of the population out of 1 .

Set up a proportion: $\frac{0.48}{1.00}=\frac{614}{x}$, where $x$ is the total number of students in the school. Cross-multiply: $0.48 x=614$. Divide both sides by 0.48 and you get approximately 1,279 .
34.

$$
\frac{5}{13} \text { or } 0.384 \text { or } 0.385
$$

Draw a right triangle and label a non-right angle $\theta$. SOHCAHTOA tells you that tangent is $\frac{\text { opposite }}{\text { adjacent }}$, so the leg opposite $\theta$ is 12 and the leg adjacent to $\theta$ is 5 . Cosine is $\frac{\text { adjacent }}{\text { hypotenuse }}$, so you need to find the hypotenuse of the triangle. You can use the Pythagorean theorem, or you can recognize this as a 5-12-13 Pythagorean triplet. The hypotenuse is therefore 13 . The leg adjacent to $\theta$ is still 5 , so $\cos \theta=\frac{5}{13}$.
35. 7,054 First, you need to determine the current exchange rate. The $7 \%$ fee is the same (relative to the exchange rate), whether it was applied to the Cedi or USD. Therefore, $7 \%$ of 651 Cedi is equal to 32.30 USD. Translate English to math: $0.07(651)=32.30$, or 45.57 Cedi $=32.30$ USD. Next, you want the value of an item worth 5,000 USD in Cedi, so set up a proportion: $\frac{45.57 \mathrm{Cedi}}{32.30 \mathrm{USD}}=\frac{x \mathrm{Cedi}}{5,000 \mathrm{USD}}$. Cross-multiply: $(45.57)(5,000)=32.30 x$, or $227,850=32.30 x$. Divide both sides by 32.30 and you get $x=7,054.18$ USD, which rounds to 7,054 .

## 63.6 or

First, draw a square inscribed in a circle. Because the diameter of the circle is equal to the diagonal of the square, you can plug in a number like $2 \sqrt{2}$ for the length of the diameter. Because the diameter forms a $45^{\circ}-45^{\circ}-90^{\circ}$ triangle, each side of the square has a length of 2 . Using the area formula for a square ( $A=s^{2}$ ), plug in 2 for the $s$ to get $A=2^{2}$, which simplifies to $A=4$. The area of the square is 4 . To find the area of the circle, use the formula $A=\pi r^{2}$. Because the diameter of the circle is $2 \sqrt{2}, r=\sqrt{2}$. Plug that into the area formula to see that $A=\pi(\sqrt{2})^{2}$, which simplifies to become $A=2 \pi$. To find the solution to the problem, translate what you are being asked from English into math. The area of the square is what percent of the area of the circle becomes: $4=\frac{x}{100} 2 \pi$. Solve for $x$ : First, divide each side by $2 \pi$, and then multiply each side by 100 . The answer is a non-repeating decimal beginning 63.66197...When entering your answer, simply cut off the decimal (do not round) so it takes up four spaces. You should enter 63.6.
37.

$$
\frac{7}{10} \text { or } 0.7
$$

If the mean of the new set is $\frac{5}{6}$, then the sum of the diameters of the cylinders divided by the number of cylinders must equal $\frac{5}{6}$. Set up the equation: $\frac{5}{6}=$ $\frac{\frac{1}{2}+\frac{3}{4}+\frac{4}{5}+1+\frac{5}{4}+x}{6}$,w by 6 to simplify: $5=\frac{1}{2}+\frac{3}{4}+\frac{4}{5}+1+\frac{5}{4}+x$. Combine like terms (use your
calculator, but be careful with parentheses!): $5=\frac{43}{10}+x$. Subtract $\frac{43}{10}$ from both sides and you get $\frac{7}{10}$.
38.

$$
1 \leq y \leq 1.25
$$

A set with an even number of elements will have as its median the average of the middle two terms. In the current set, $\frac{4}{5}$ and 1 have an average of $\frac{9}{10}$, so the new cylinder must be equal to or greater than 1 , so the median will be the average of $\frac{4}{5}$ and 1 . The range of the set of five cylinders is the greatest minus the least: $\frac{5}{4}-\frac{1}{2}=\frac{3}{4}$. Because the new cylinder must be $\frac{1}{4}$ inches to $\frac{1}{2}$ greater than $\frac{3}{4}$, the cylinder must be between 1 and $\frac{5}{4}$ inches in diameter.

## Chapter 22 <br> Practice Test 2

# Math Test - No Calculator <br> 25 MINUTES, 20 QUESTIONS 

Turn to Section 3 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-15, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 16-20, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 16 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is not permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$A=\pi r^{2}$
$C=2 \pi r$

$V=\ell w h$

$V=\pi r^{2} h$

$V=\frac{4}{3} \pi r^{3}$

$V=\frac{1}{3} \pi r^{2} h$

$V=\frac{1}{3} \ell w h$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

If two times a number is equal to that number minus 4 , what is the number?
A) -7
B) -6
C) -4
D) -3

2
The number of soil samples, $s$, that Sonal needs for an experiment must be greater than 6 but less than or equal to 13 . Which of the following represents an acceptable number of soil samples for Sonal's experiment?
A) $6<s<13$
B) $6 \leq s<13$
C) $6<s \leq 13$
D) $6 \leq s \leq 13$

In the figure above, the graph of $y=f(x)$ is shown. Which of the following could be the equation of $f(x)$ ?
A) $f(x)=-\frac{3}{5} x+3$
B) $f(x)=-\frac{3}{5} x-3$
C) $f(x)=\frac{3}{5} x-3$
D) $f(x)=\frac{3}{5} x+3$

4
If $x+y=0$, which of the following must be equivalent to $x-y$ ?
A) $-2 y$
B) $\frac{x}{y}$
C) $x$
D) $x^{2}$

5
Which of the following is equivalent to $2 x^{2}-6 x-8$ ?
A) $2(x-4)(x+1)$
B) $3(x+4)(x-1)$
C) $2(x-3)(x+2)$
D) $3(x-4)(x-2)$

Ryan and Allison build a ramp to help their elderly cat, Simms, walk up to their bed. They need the ramp to make a $35^{\circ}$ angle with their bedroom floor. How long must the ramp be to reach the top of their bed that is exactly three feet off the ground?
A) $\frac{\sin 35^{\circ}}{3}$
B) $\frac{\sin 55^{\circ}}{3}$
C) $\frac{3}{\sin 55^{\circ}}$
D) $\frac{3}{\sin 35^{\circ}}$

If $3 a+2 b=24$ and $4 a+5 b=53$, what is the value of $a+b$ ?
A) 2
B) 7
C) 9
D) 11

Given the equation $y=3 x^{2}+4$, what is the function of the coefficient of 3 ?
A) It moves the graph of $y=3 x^{2}+4$ three units higher than the graph of $y=x^{2}+4$.
B) It moves the graph of $y=3 x^{2}+4$ three units lower than the graph of $y=x^{2}+4$.
C) It makes the graph of $y=3 x^{2}+4$ wider than the graph of $y=x^{2}+4$.
D) It makes the graph of $y=3 x^{2}+4$ narrower than the graph of $y=x^{2}+4$.

9
Steven needs to buy $t$ theme park tickets for himself and his family. Each ticket costs $\$ 80$, and the number of tickets he needs to buy can be modeled by the expression $t^{2}-4 t-90=6$ when $t>0$. What is the total cost of the theme park tickets that Steven purchased?
A) $\$ 640$
B) $\$ 800$
C) $\$ 960$
D) $\$ 1,120$

10

$$
\begin{aligned}
& 2 c+3 d=17 \\
& 6 c+5 d=39
\end{aligned}
$$

In the system of linear equations above, what is the value of $4 c-4 d$ ?
A) -4
B) 1
C) 4
D) 13

11
If $x^{2}+2 x y+y^{2}=64$ and $y-x=12$, which of the following could be the value of $x$ ?
A) -10
B) -4
C) 2
D) 10

12
Samantha offers two different packages of yoga classes at her yoga studio. She offers two hot yoga sessions and three zero gravity yoga sessions at a total cost of $\$ 400$. She also offers four hot yoga sessions and two zero gravity sessions at a price of $\$ 440$. Samantha wants to offer a larger package for long-time clients in which the cost must exceed $\$ 800$. If Samantha does not wish to include more than 13 sessions for the long-time client package, will she be able to create this package for her clients?
A) No, because the closest package that she can offer consists of three hot yoga and three zero gravity yoga sessions.
B) No, because the closest package that she can offer consists of four hot yoga and four zero gravity yoga sessions.
C) Yes, because she can offer five hot yoga and five zero gravity yoga sessions.
D) Yes, because she can offer six hot yoga and six zero gravity yoga sessions.

13
Cuthbert is conducting a chemistry experiment that calls for a number of chemicals to be mixed in various quantities. The one amount of which he is unsure is grams of potassium, $p$. If Cuthbert is certain that $\left(3 p^{2}+14 p+24\right)-2\left(p^{2}+7 p+20\right)=0$, what is one possible value of $3 p+6$, the exact number of grams of potassium that Cuthbert would like to use for this experiment?
A) 20
B) 18
C) 12
D) 10

## 14

What is the value of $(2+8 i)(1-4 i)-(3-2 i)(6+4 i)$ ?
(Note: $i=\sqrt{-1}$ )
A) 8
B) 26
C) 34
D) 50

15
If $2 \sqrt{x}=x-3$, which of the following is the solution set for $x$ ?
A) $\{-1,9\}$
B) $\{1,-9\}$
C) $\{9\}$
D) $\{1,9\}$

## 16

A group of students at Omega High School are using staples and popsicle sticks to build a scale model of the Great Wall of China as part of a project detailing China's military history. The number of staples the students will need is three times the number of popsicle sticks they will need. If the students determine they need 84 staples for this particular project, how many popsicle sticks will they need?

## 17

A standard parabola in the $x, y$-coordinate plane intersects the $x$-axis at $(5,0)$ and $(-5,0)$. What is the value of the $x$-coordinate of this parabola's line of symmetry?

18
Danielle is a civil engineer for Dastis Dynamic Construction, Inc. She must create blueprints for a wheelchair accessible ramp leading up to the entrance of a mall that she and her group are building. The ramp must be exactly 100 feet in length and make a $20^{\circ}$ angle with the level ground. What is the horizontal distance, in meters, from the start of the ramp to the point level with the start of the ramp immediately below the entrance of the mall, rounded to the nearest meter? (Disregard units when inputting your answer.)
(Note: $\sin 20^{\circ} \approx 0.324, \cos 20^{\circ} \approx 0.939, \tan 20^{\circ} \approx 0.364$ )

If twice a number is equal to that number minus five, what is three times that number plus seventeen minus that number?

20
Given that the equation $3 x^{2}+2 x-8=0$ has two distinct solutions, what is the value of the smaller solution subtracted from the larger solution?

## STOP

If you finish before time is called, you may check your work on this section only. Do not turn to any other section in the test.

## Math Test - Calculator

## 55 MINUTES, 38 QUESTIONS

Turn to Section 4 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-30, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 31-38, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 31 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$V=\ell w h$

$V=\pi r^{2} h$

$V=\frac{4}{3} \pi r^{3}$

$V=\frac{1}{3} \pi r^{2} h$

$V=\frac{1}{3} \ell w h$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

4

1
If $3 y=y+2$, what is the value of $2 y$ ?
A) 1
B) 2
C) 3
D) 4

2
Merry joined an online community that charges a monthly fee of $\$ 15$. A one-time enrollment fee of $\$ 50$ was charged when she joined. Which of the following represents the total amount of fees that Merry has paid to the community organizers after $m$ months, in dollars?
A) $15 m+50$
B) $15+50 m$
C) $15 m-50$
D) $(15+50) m$

## 3

Rob has his favorite guitar tuned up and ready to bring to a performance by his cover band at a local venue Saturday. He decides at the last minute to bring $x$ additional guitars, just in case his favorite guitar has an issue. If the total number of guitars that Robert brings to the performance can be modeled as $x+1$, what does the " +1 " account for in the expression?
A) It accounts for an additional guitar that Rob returns to his house and picks up in the middle of the performance.
B) It accounts for his favorite guitar, which Rob was bringing from the beginning.
C) It accounts for the number of additional guitars that Rob decided to bring.
D) It accounts for an additional non-guitar musical instrument that Rob decided to bring.

4
A group of 24 students was polled as to whether they enjoy biology class, chemistry class, both, or neither. The results are shown in the table below:

|  | Biology | Chemistry |
| :--- | :---: | :---: |
| Enjoy | 14 | 18 |
| Don't Enjoy | 10 | 6 |

Given the above data, which of the following conclusions is true?
A) The ratio of those who enjoy biology class to those who enjoy chemistry class is 7:8.
B) The ratio of those who enjoy chemistry class to those who don't enjoy chemistry class is 9:4.
C) The ratio of those who enjoy biology class to those who don't enjoy chemistry class is 7:2.
D) The ratio of those who don't enjoy biology class to those who enjoy chemistry class is 5:9.

5
Dr. Goldberg, a noted dietician, mixes different solutions as part of her research into sugar substitutes. By weight, she mixes $40 \%$ of a sample of substitute A and $70 \%$ of a sample of substitute $B$ to create substitute C. If Dr. Goldberg initially had 60 grams of substitute $A$ and 110 grams of substitute $B$, then what would be the weight, in grams, of substitute $C$ ?
A) 24
B) 77
C) 101
D) 170

6
Which of the following is equivalent to the expression $x^{4}-x^{3}-x^{2}$ ?
A) $x\left(x^{2}-x-1\right)$
B) $x\left(x-x^{2}-x^{3}\right)$
C) $x\left(x^{3}-x^{2}\right)$
D) $x^{2}\left(x^{2}-x-1\right)$

Officer Blake drives his squad car 1 mile per minute while patrolling local highways during his shift. If he has driven 480 miles by the end of his shift, how many total hours did he drive his car at the above rate?
A) 8
B) 12
C) 16
D) 20

8
In the inequality $37 \leq-2 x+1$, what is the appropriate order of steps needed to solve the inequality for $x$ ?
A) Add 1 to both sides, divide both sides by 2 , and flip the inequality sign to $\geq$.
B) Subtract 1 from both sides, divide both sides by -2 , and flip the inequality sign to $\geq$.
C) Add 1 to both sides, divide both sides by -2 , and keep the original inequality sign.
D) Subtract 1 from both sides, divide both sides by 2, and keep the original inequality sign.

9
What is the value of $\left(2 x^{2}+4 x+8\right)-\left(2 x^{2}-4 x+7\right)$ ?
A) $4 x^{2}+8 x+15$
B) $2 x^{2}+x+1$
C) $8 x+1$
D) $8 x+15$

10
As part of a project for his cartography elective, Adam climbs several hills to create a relief map for the woods surrounding his house. He records the vertical heights of the five hills he climbed at 55 feet, 42 feet, 38 feet, 50 feet, and 48 feet. For his project, Adam must convert his measurements to inches. If 1 foot $=$ 12 inches, what is the measurement, in inches, of the tallest hill Adam will have on his map?
A) 660
B) 600
C) 576
D) 456

11

In the figure above, if $y=40$ and $\overline{L N}=8$, which of the following most closely approximates the length of $M N$ ?
A) 0.10
B) 9.53
C) 10.44
D) 12.45

## 12

McCoy Max Speed, Inc. makes custom skateboards for its customers. Two wooden skateboards and three composite skateboards cost $\$ 650$. Three wooden skateboards and one composite skateboard cost $\$ 450$. How much would McCoy Max Speed charge a customer who purchases five wooden skateboards and four composite skateboards?
A) $\$ 500$
B) $\$ 600$
C) $\$ 1,000$
D) $\$ 1,100$

4

13
The chart below shows data about the number of employees at Cuda Cola, a popular beverage company.

|  | $\mathbf{2 0 1 2}$ | $\mathbf{2 0 1 3}$ | $\mathbf{2 0 1 4}$ |
| :--- | :--- | :--- | :--- |
| Total Employees | 1,670 | 1,890 | 2,110 |
| Percent Male | $65 \%$ | $60 \%$ | $55 \%$ |
| Percent Female | $35 \%$ | $40 \%$ | $45 \%$ |

Assuming the employee total grows at the same rate each year, and male and female percentages continue to decrease and increase by $5 \%$, respectively, approximately how many male employees will work at Cuda Cola in 2015 ?
A) 1,515
B) 1,398
C) 1,282
D) 1,165

## 14

John Croxley, the mayor of Black Rock, NY, is counting the number of restaurants that have opened in his town per month for the last seven months. He compiles the seven numbers into Set F , which contains the elements $4,5,11,13,16,18$, and $x$. If both the median and average (arithmetic mean) of Set F equal 11, what must be the value of $x$, the unknown number of restaurants that opened in Mayor Croxley's town last month?
A) 9
B) 10
C) 11
D) 12

15

$$
\begin{aligned}
& 17 s+20 t=59 \\
& 30 s+40 t=110
\end{aligned}
$$

In the system of equations above, what is the value of $t$ in terms of $s$ ?
A) $\frac{2 s}{5}$
B) $\frac{s}{5}$
C) $\frac{5}{2 s}$
D) $\frac{5}{s}$

16

Given the scatterplot graph above, ten students at Welton Academy were polled at random about their usage of the school's new physics-centered social media app, E = MC Shared. The app was developed to encourage students to discuss physics curricula and concepts in ways that mirrored social media trends in 2013. Students were asked how many times they logged into the app each day as well as how many posts they actually made using the app. With the given data, what conclusions can be drawn about this group of students?
A) The majority of students polled logged in more times per day than they posted.
B) The majority of students polled posted more times per day than they logged in.
C) The majority of students polled logged in and posted an equal number of times.
D) No relationship can be drawn between logins per day and posts per day.

17

Two graphs, $f(x)$ and $h(x)$, are shown above. If $f(x)=3 x$ +4 and $f(x)$ and $h(x)$ are perpendicular, which of the following could be the equation of $h(x)$ ?
A) $h(x)=\frac{1}{3} x+9$
B) $h(x)=-\frac{1}{3} x+9$
C) $h(x)=3 x+9$
D) $h(x)=-3 x+9$

## 18

The number of eggs that Farmer Jones has in his chicken coop will grow exponentially as Farmer Jones buys more chickens to increase production. The number of eggs Farmer Jones has in the coop can be modeled by the equation $y=3^{x}$ beginning on Day 1 , where $x$ is given by $x=1$, and $y$ is the number of eggs currently in the coop. If the coop can support only 4,000 eggs, and Farmer Jones empties the coop every day, on which day will the chickens produce too many eggs for the coop to support?
A) Day 6
B) Day 7
C) Day 8
D) Day 9

19

If $a=\frac{4 a^{2}}{16}$ and $a$ is a nonzero integer, which of the following is equivalent to $a$ ?
A) $4 a$
B) $4 \sqrt{a}$
C) $\sqrt{2 a}$
D) $2 \sqrt{a}$

## 20

Three different chefs work together to prepare meals for 280 dinner guests. Each works at a different speed, and their combined output throughout the night is modeled by the equation $8 x+4 x+2 x=280$. If $x$ is a positive integer, which of the following could $8 x$ represent in the equation?
A) The total meal output by the slowest chef, who made 40 meals.
B) The total meal output by the fastest chef, who made 160 meals.
C) The total meal output by the fastest chef, who made 80 meals.
D) The difference between the output between the slowest and fastest chef, which would be 120 meals.

4

21

The graph, $y=f(x)$, shown above models the performance of a certain crop, where $x$ is the nutrients subtracted or added to the soil and $y$ is the gain or loss of pieces of fruit added to the total harvest. A more powerful fertilizer that is used causes the graph $y=f(x)$ to be reflected over the line $y=x$. Which of the following best describes the behavior of the crop with the new fertilizer?
A) For every three nutrients added to the soil, the crop loses two additional fruits for the total harvest.
B) For every two nutrients added to the soil, the crop loses two additional fruits for the total harvest.
C) For every three nutrients added to the soil, the crop adds two additional fruits to the total harvest.
D) For every two nutrients added to the soil, the crop adds three additional fruits to the total harvest.

## 22

George and Joe both interview the same 20 fellow students regarding their interest in their school's new Model UN Club. George asked the students to respond with Interested, Sort of Interested, and Not Interested. Joe asked the students to rate their interest on a scale of 1 to 5 . The results of the polls are below.

George's Poll

| Response | Number of <br> Students |
| :--- | :--- |
| Interested | 8 |
| Sort of Interested | 5 |
| Not Interested | 7 |

Joe's Poll

| Rating | Number of <br> Students |
| :--- | :--- |
| 1 | 5 |
| 2 | 4 |
| 3 | 3 |
| 4 | 4 |
| 5 | 4 |

After reviewing the data, the Model UN advisors determine that Joe neglected to include whether a 1 or 5 was the best rating in his report. What additional piece of information would most help the advisor determine whether a 1 or 5 was the best rating?
A) Requesting that George redo his poll with the same rating system as Joe's poll.
B) Requesting that Joe redo his poll with the same rating system as George's poll.
C) Polling all of the students who said "Interested" in George's Poll and asking them to choose between "Extremely Interested" and "Very Interested."
D) Polling all of the students who gave a " 1 " rating in Joe's poll and ask them if they are interested in Model UN.

4

## 23

Each winter, Captain Dan's Ski Lodge rents both pairs of skis and snowboards to its guests for a flat daily rate per pair of skis and a flat daily rate per snowboard. Five pairs of skis and two snowboards will cost a family $\$ 370$. Three pairs of skis and four snowboards will cost a family $\$ 390$. During a particularly slow season, Captain Dan announces a $10 \%$ discount on all skis and snowboards. What would be the cost of renting two pairs of skis and two snowboards if they were rented during this discount period?
A) $\$ 99$
B) $\$ 110$
C) $\$ 198$
D) $\$ 220$

24

If $8 x+8 y=18$ and $x^{2}-y^{2}=-\frac{3}{8}$, what is the value of $2 x-2 y$ ?
A) $-\frac{1}{3}$
B) $-\frac{1}{6}$
C) $\frac{1}{3}$
D) $\frac{1}{6}$

## 25

Shaun is developing a weight loss regimen, which includes both a workout plan and a calorie-restriction plan. Shaun wants to work out for no less than 30 minutes and no more than 60 minutes a day and consume no less than 2,000 and no more than 2,500 calories. If each minute, $m$, of his workout time burns 50 calories, which of the following inequalities represents the number of minutes, $m$, that Shaun can work out each day to burn off as many calories as he consumes?
A) $30 \leq m \leq 60$
B) $30 \leq m \leq 50$
C) $40 \leq m<50$
D) $40 \leq m \leq 50$

A professional baseball team wishes to average 45,500 ticket purchases per game for the entire 162-game season. Through the first 60 games of the season, the team has averaged 43,000 ticket purchases per game. Which of the following most closely approximates how many ticket purchases per game the team must average for the remainder of the season in order to hit its overall goal of an average of 45,500 ticket purchases per game for the season?
A) 46,970
B) 47,880
C) 48,000
D) 48,220

4

A certain polynomial, $P$, has a degree of 2 .
Polynomial $P$ has zeros of 2 and -3 , and $a>0$ when the function of polynomial $P$ is written in the form of $y=a x^{2}+b x+c$. Given this information, which of the following could be the graph of polynomial $P$ ?
A)

B)

C)

D)

28
Circle $O$ (not shown) is divided into three sectors. Points $P, Q$, and $R$ are on the circumference of the circle. Sector $P O R$ has an area of $8 \pi$, and sector $R O Q$ has an area of $6 \pi$. If the radius of circle $O$ is 4 , what is the measure of the central angle of sector $Q O P$, in degrees?
A) 45
B) 90
C) 135
D) 180

Medical residents at Lakewood Hospital are choosing their individual specialties. Among them, $40 \%$ choose cardiology, $16 \%$ choose oncology, $34 \%$ choose endocrinology, and the remaining $x \%$ choose hematology. Once the doctors pick their first specialty, they are then each asked to choose a second specialty from the previous four options in case their original specialty is already filled. They may not pick their original specialty again. $20 \%$ of those who originally picked cardiology choose oncology as their second choice. If no other field chooses oncology as their second choice, and the hospital boasts 200 medical residents, then what is the total number of residents who named oncology as either their first or second choice, in terms of $x$ ?
A) $8 x-128$
B) $8 x-144$
C) $x^{2}+24 x-188$
D) $x^{2}-24 x+188$

4

30
Mr. Lastorka's science class is running experiments with an energy-efficient model electric car. As the initial rate of energy delivered to the car, measured in watts, increases, the number of millimeters moved by the car from its starting position increases exponentially. The results of several trial runs are shown on the scatterplot graph below.

Based on the data, the students in Mr. Lastorka's class determine the exact equation involving Watts, $x$, and total distance from start, $y$. They call the function $y=f(x)$. Mr. Lastorka then instructs his class to reflect $y=f(x)$ over the $x$-axis. He challenges each student to determine the new function and what it would mean from a physics perspective. Four student pairs gave their answers below. Who is correct, and for what reasons?
A) Charles and Shannon, who identify the new equation as $y=-2^{x}$ and explain that the new graph indicates that the car is still moving forward at the same rate as before.
B) Michael and Lauren, who identify the new equation as $y=-2^{x}$ and explain that the new graph indicates the car is now moving in reverse at the same rate as before.
C) Matthew and Karen, who identify the new equation as $y=2^{-x}$ and explain that the new graph indicates that the car is now moving forward more rapidly than before.
D) Andy and Joanie, who identify the new equation as $y=2^{-x}$ and explain that the new graph indicates that the car is no longer moving in any direction.

31
What number divided by two is equal to that same number minus 15 ?

32
The number of hours Robert spends in his game room is proportional to the number of hours he spends playing Call of Destiny IV: Modern Battlefield. If he plays Call of Destiny IV for 6 hours, he will spend 8 hours in his game room. How many hours will Robert spend in his game room if he plays Call of Destiny IV for only 3 hours?

Twelve Smooth-Glide pens and eight Easy-Write pencils cost exactly $\$ 16.00$ at Office World. Six Smooth-Glide pens and ten Easy-Write pencils cost $\$ 11.00$ at the same location. How much will nine Smooth-Glide pens and nine Easy-Write pencils cost at Office World? (Disregard the dollar sign when gridding your answer.)

In the equation $3 x^{2}-16 x=-20$, what is one possible value of $x$ ?

In a certain ancient farming community, anthropologists determine that new dwellings were constructed monthly as modeled by the function $f(x)=2 x+100$, where $x$ is the current month of the year and $f(x)$ is the number of dwellings constructed by the end of that month. Additionally, they determine that the population grew exponentially each month, thanks to the discovery of more fertile land for farming. This growth is modeled by the equation $g(x)=3^{x}$, where $g(x)$ represents the current population at the end of a given month. What is the smallest integer value of $x$, with 1 representing the end of January and 12 representing the end of December, at which the population surpasses the number of dwellings built?

36
In a school-wide competition held at Saul C. Tigh Memorial High School, Olympiad teams are challenged to come up with different circuits involving both real and imaginary currents. Imaginary currents exist in spots where the electrical energy encounters zero resistance, such as through a coil or wire. Real currents exist only where the electrical energy headed through the circuit encounters resistance, such as when a light bulb "resists" the current and takes up some of the energy carried throughout the circuit.

The members of Team Charlie develop a circuit in which the total current, real and imaginary, can be measured at $50+12 i$ amps. They then add the current together with the current produced by Team Delta's circuit, $40-9 i \mathrm{amps}$. Finally, they decide to multiply the resulting current, in amps, by Team Epsilon's total current, $60-2 i$ amps. What is the final current, in amps, after the entire process is completed?

## Questions 37 and 38 refer to the following information.

The chart below shows the population distribution for the 2,400 occupants of the city of Centre Hill.

|  | Adult <br> Male | Adult <br> Female | Child |
| :--- | :---: | :---: | :---: |
| \% Living in Uptown | 9 | 8 | 6 |
| \% Living in Midtown | 22 | 20 | 15 |
| \% Living in Downtown | 21 | 22 | 12 |
| \% Living in Suburbs | 48 | 50 | 67 |

37
If there are an equal number of adults and children, and adult females outnumber adult males by 200 , what is the sum of the women living uptown and the children living in the suburbs of Centre Hill?

38
Centre Hill plans to annex the area around a nearby lake. This new part of Centre Hill will be called, appropriately, The Annex. The Annex will add to the current population of Centre Hill. The percent of adult males living in Uptown will decrease to 6\% after incorporating The Annex into Centre Hill. If the information from Part 1 holds true for the original four districts of the city of Centre Hill, then how many adult males live in The Annex?

## STOP

If you finish before time is called, you may check your work on this section only. Do not turn to any other section in the test.

## Section 3: Math (No Calculator)

1. C Translate the question into an equation. Let $x$ equal the number, and then $2 x=$ $x-4$. Solving for $x$, we find that $x=-4$. This is (C).
2. C Sonal needs $s$ soil samples. If according to the question, he must have more
than 6 samples, then $s>6$. Also according to the question, he may have no more than 13 samples, so $s \leq 13$. Combining these two expressions, we find that $6<s \leq 13$. This is (C).
3. D The graph of $f(x)$ has a $y$-intercept at $y=3$. Because of this, we know that when $y=3, x=0 . f(x)$ must then satisfy the condition that $f(0)=3$. This is true only for (A) and (B). Alternatively, by recognizing that each equation is in the slope-intercept form: $f(x)=y=m x+b$, where $b$ is the $y$-intercept, we can reach the same conclusion. Next, notice that the slope of the line is positive. That is, as the value of $x$ increases, so too does $y$. Returning to the slopeintercept form, $m$ gives the slope of the line. Only (D) has a positive coefficient $(m)$. Choice (D), then, is the correct function.
4. A If $x+y=0$, then $x=-y$. Using this relationship and substituting into the expression $x-y$, we find that $x-y=-y-y=-2 y$. This is (A).
5. A This question requires factoring the expression $2 x^{2}-6 x-8$. Begin by factoring 2 from the expression: $2\left(x^{2}-3 x-4\right)$. This expression is further factorable, giving $2(x-4)(x+1)$, which is (A).
6. D The question describes a ramp that forms a triangle, the length of which is the hypotenuse of the triangle. The height of the ramp ( 3 feet) is the length of the side of the triangle opposite the $35^{\circ}$ angle. In general for some angle $\theta, \sin \theta=$ $\frac{\text { opposite }}{\text { hypotenuse }}$. In the question, this corresponds to $\sin 35^{\circ}=\frac{\text { opposite }}{\text { hypotenuse }}=$ $\frac{3}{\text { lengthof ramp }} \Rightarrow$ length of ramp $=\frac{3}{\sin 35^{\circ}}$. This is (D).
7. D This question requires evaluating both equations to determine the values of $a$ and $b$. You could begin by solving either of the two equations for $a$ or $b$, and then substituting the solution into the other equation. But note that the question asks for the value of $a+b$, so check to see if there's a faster way: Could you stack and add (or subtract) the equations? If you stack and add the equations, you get $7 a+7 b=77$. Now divide both sides of the equation by 7 , resulting in $a+b=11$. This is (D).
8. D When a function $f(x)$ is transformed into a function of the form $f(a x)$, where $a$ is a constant, if $a>0$, the function will be compressed horizontally by a factor
of $a$. Here, $y=x^{2}+4$ can be represented as the parent function, and $y=3 x^{2}+$ 4 as the transformed function compressed horizontally versus the parent function, and thus narrower, by a factor of 3 . This is (D). If you're not sure, try plugging values into each equation to construct a rough graph of each equation and compare them.
9. C Rearranging and factoring the expression provided in the question, we have $t^{2}$ $-4 t-90=6 \Rightarrow t^{2}-4 t-96=0 \Rightarrow(t-12)(t+8)=0$. Therefore, $t-12=0$ and $t+8=0$. $t$ must then equal 12 or -8 . If $t$ represents the number of tickets Steven buys, then only $t=12$ is consistent with the context of the question. If each ticket costs $\$ 80$, Steven must have spent $\$ 80 \cdot 12=\$ 960$. This is (C).
10. C We must find values of $c$ and $d$ by solving the system of equations in order to determine the value of $4 c-4 d$. There are several ways to go about this. One way is to multiply the terms of the equation $2 c+3 d=17$ by -3 to get $-6 c-9 d$ $=-51$. If you stack and add this equation with the second equation, the result is $-4 d=-12$, which solves to $d=3$. Plug this value for $d$ into the equation $6 c+$ $5 d=39$ to get $6 c+15=39$, so $6 c=24$ and $c=4$. Therefore, $4 c-4 d=4(4)-$ $4(3)=16-12=4$. This is (C).
11. A Factoring the left side of the equation $x^{2}+2 x y+y^{2}=64$ gives $(x+y)^{2}=64$. Taking the square root of both sides of the equation, we find that $x+y=8$ or -8 . The other equation provides that $y-x=12$, so $y=x+12$. Substitute this value of $y$ into the first equation: either $x+(x+12)=8$, so $2 x+12=8,2 x=$ -4 , and $x=-2$, or else or $x+(x+12)=-8$, so $2 x+12=-8$, so $2 x=-20$, and $x$ $=-10$. Therefore, $x$ could be either -2 or -10 , and only -10 is an option in the answers, so (A) is correct.
12. D Translate from English to math in bite-sized pieces. Make the price of a hot yoga lesson $h$ and the price of a zero gravity yoga session $z$. If she offers 2 hot yoga and 3 zero gravity yoga sessions for $\$ 400$, then $2 h+3 z=400$. Similarly, if 4 hot yoga and 2 zero gravity yoga sessions are $\$ 440$, then $4 h+2 z=440$. Now, be sure to Read the Full Question: You want to know whether Samantha can create a package that's greater than $\$ 800$ but has fewer than 13 sessions. If you stack the two equations and then add them together, you get $6 h+5 z=$ 880 . In other words, she can offer 6 hot yoga and 5 zero gravity yoga sessions ( 11 total sessions) for $\$ 880$. This satisfies her requirements, so you know the answer is "Yes"; eliminate (A) and (B). For (C), because you don't know the
price of each lesson individually, you don't know yet whether 5 hot yoga and 5 zero gravity yoga sessions will be over $\$ 800$; leave (C) for now. For (D), if 6 hot yoga and 5 zero gravity yoga sessions were over $\$ 800$, then adding a zero gravity yoga session will still be over $\$ 800$. Given what you already know, (D) must be true; choose (D).
13. B Begin by simplifying the equation given. $\left(3 p^{2}+14 p+24\right)-2\left(p^{2}+7 p+20\right)=$ $3 p^{2}+14 p+24-2 p^{2}-14 p-40=p^{2}-16=0$. Factoring the left side of the simplified equation, we find that $(p-4)(p+4)=16$. Solving for $p$, we find that $p= \pm 4$. The value of $3 p+6$ must then be either $3(-4)+6=-6$ or $3(4)+6=$ 18 . The latter value is (B).
14. A Taking note that $i=\sqrt{-1}$, the expression $(2+8 i)(1-4 i)-(3-2 i)(6+4 i)$ becomes $(2+8 \sqrt{-1})(1-4 \sqrt{-1})-(3-2 \sqrt{-1})(6+4 \sqrt{-1})$. Expanding, this becomes $2-8 \sqrt{-1}+8 \sqrt{-1}-32(\sqrt{-1})^{2}-\left(18+12 \sqrt{-1}-12 \sqrt{-1}-8(\sqrt{-1})^{2}\right)=$ $2-32(\sqrt{-1})^{2}-18+8(\sqrt{-1})^{2}=8(\sqrt{-1})^{2}-32(\sqrt{-1})^{2}-16$. This further simplifies to $-8+32-16=8$. This is (A).
15. C Plug In the Answers! The answers aren't in order, and some numbers appear more than once, so you don't need to start in the middle. Instead, start with 9 because it is in three of the four choices. If $x=9$, then $2 \sqrt{9}=9-3 \cdot \sqrt{9}=3$, so the left side of the equation is $2 \times 3=6$, and the right side of the equation is 9 $-3=6$. This works, so 9 is part of the solution set; eliminate (B) because it doesn't include 9 . Next, $\operatorname{try} x=1: 2 \sqrt{1}=1-3$, which solves to $2=-2$. This isn't true, so 1 is not part of the solution set; eliminate (D). Lastly, try $x=-1: 2$ $\sqrt{-1}=-1-3$. You cannot take the square root of a negative number, so this doesn't work. Eliminate (A) and choose (C).
16. $\mathbf{2 8}$ Let $s$ equal the number of staples required by the students and let $p$ be the number of popsicle sticks required. If the number of staples the students will need is three times the number of popsicle sticks they will need, then $s=3 p$. If the students need 84 staples for this project, then $s=84$. Substitute 84 for $s$ to get $84=3 p$. Divide both sides by 3 to get $28=p$. The students will need 28 popsicle sticks.
17. o If a parabola intersects the $x$-axis at the points ( 5,0 ) and $(-5,0)$, it must be symmetric about the $x$-axis and centered at $x=0$. The $x$-coordinate of its vertical axis of symmetry must then be $o$.
18. 94 The question describes a 100 foot ramp that forms a triangle. The length of this ramp corresponds to the hypotenuse of a triangle. The height of the ramp is the length of the side of the triangle opposite the $20^{\circ}$ angle; the horizontal distance from the start of the ramp immediately below the entrance of the mall is the side of the triangle adjacent to the $20^{\circ}$ angle. The function that relates adjacent and hypotenuse is $\operatorname{cosine}: \cos \theta=\frac{\text { opposite }}{\text { hypotenuse }}$. In this problem, $\cos 20^{\circ}=\frac{x}{100}$, where $x$ is the horizontal distance. Solve by multiplying both sides by 100: $\cos 20^{\circ}=x$. Next, replace $\cos 20^{\circ}$ with the value given in the problem, 0.939 : $100(0.939)=x$. Multiply 100 by 0.939 to get $x=93.9$, which rounds to 94 .
19. 7 Let $x$ equal the number. Then, $2 x=x-5 \Rightarrow x=-5$. Three times that number plus seventeen minus that number is $3(-5)+17-(-5)=7$.
20. $\frac{10}{3} 3 x^{2}+2 x-8=(-2-x)(4-3 x)=0$. Solving $-2-x=0$ and $4-3 x=0$ for $x$, we find that the two solutions for $x$ are -2 and $\frac{4}{3}$. The question asks us to subtract the value of the smaller solution from the larger solution. This difference is $\frac{4}{3}$ $-(-2)=\frac{4}{3}+\frac{6}{3}=\frac{10}{3}$.

## Section 4: Math (Calculator)

1. B To solve this question, simply subtract $y$ from both sides of the equation to get $2 y=2$, which is (B).
2. A Whenever the question includes variables, plug in. If $m=2$, then Merry would pay the one-time enrollment fee plus 2 months' worth of monthly fees, which is $50+15(2)=80$. Plug in 2 for $m$ in the answer choices to see which answer equals the target number of 80 . In (A), $15(2)+50=80$. This is the target number, so leave this answer, but be sure to check the other choices just in
case. In (B), $15+50(2)=115 . \operatorname{In}(C), 15(2)-50=-20$, and in (D), $(15+50)$ $(2)=130$. Since none of the other answer choices equals the target number, the correct answer is (A).
3. B Since the question states that Rob is planning to bring his favorite guitar plus $x$ additional guitars, he will have a total of $x+1$ guitars. The question states that the variable $x$ represents the number of additional guitars, so the number 1 must represent Rob's favorite guitar, which is (B).
4. D The best way to approach this question is through POE. According to the data in the table, the ratio of those who enjoy biology to those who enjoy chemistry is 14 to 18 , which can be reduced to a ratio of 7 to 9 ; eliminate (A). The ratio of those who enjoy chemistry to those who don't enjoy chemistry is 18 to 6 , which can be reduced to a ratio of 3 to 1 ; eliminate (B). The ratio of those who enjoy biology to those who don't enjoy chemistry is 14 to 6 , which can be reduced to a ratio of 7 to 3 ; eliminate (C). The ratio of those who don't enjoy biology to those who enjoy chemistry is 10 to 18 , which can be reduced to a ratio of 5 to 9 ; this matches (D).
5. C Dr. Goldberg takes $40 \%$ of substitute A, which consists of 60 grams. Mathematically, this can be expressed as $\frac{40}{100}(60)$ or $(0.4)(60)=24$ grams. She takes $70 \%$ of substitute B, which consists of 110 grams. Mathematically, this can be expressed as $\frac{70}{100}(110)$ or $(0.7)(110)=77$ grams. Substitute $C$ will therefore consist of 24 grams +77 grams $=101$ grams, which is $(C)$.
6. D To solve this question, simply factor out the largest value that fits within each of the terms in the expression provided. In this case, $x^{4}, x^{3}$, and $x^{2}$ are all divisible by $x^{2}$, so that is what you will want to factor out. Doing so will leave you with $x^{2}\left(x^{2}-x-1\right)$, which is (D).
7. A Since Officer Blake drives 480 miles at a rate of 1 mile per minute, his total drive time was 480 minutes. The question asks for Officer Blake's driving time in hours, so you need to convert those minutes into hours. Since there are 60 minutes in 1 hour, you can divide 480 minutes by 60 to determine that Officer Blake drove for 8 hours, which is (A).
8. B The goal here is to isolate $x$. Since the right-hand side of the equation is $-2 x+$ 1 , you will want to subtract 1 from both sides, so eliminate (A) and (C). To get $x$ by itself, you will want to divide by -2 , not 2 , so eliminate (D) and choose (B). Remember that when you multiply or divide across an inequality sign using a negative number, you need to flip the inequality sign in the opposite direction, as reflected in (B).
9. C To solve this question, rearrange the expressions $\left(2 x^{2}+4 x+8\right)$ and $\left(2 x^{2}-4 x\right.$ +7 ) in order to place the similar terms next to each other. Doing so will give you $2 x^{2}-2 x^{2}+4 x-(-4 x)+8-7$ (remember to distribute the negative sign for each of the terms in the second expression). Simplifying this new expression will yield $o+8 x+1$, or $8 x+1$, (C). Another way to approach this question would be to plug in a simple number for $x$, such as $x=2$, and match your target value with the values in the answer choices.
10. A The tallest hill that Adam measures is 55 feet high. Since 1 foot is equivalent to 12 inches, simply multiply $55 \times 12=660$ inches, $(A)$.
11. B Triangle legs $L N$ and $M N$ are opposite and adjacent, respectively, to $\angle y$. Therefore, from SOHCAHTOA, we need to use the tangent trigonometric function. Plugging in the values that the question gives us into the equation for tangent, we get $\tan 40^{\circ}=\frac{8}{M N}$. Now, use your calculator to determine that the length of $M N$ most closely approximates 9.53 , which is (B).
12. D If you represent the wooden skateboards with a $w$ and the composite skateboards with a $c$, you can write two equations based on the information given in the question: $2 w+3 c=650$ and $3 w+c=450$. It is possible to isolate one of the variables and solve these two equations by substitution, but in this case it is easier simply to stack the equations on top of each other and add them together as follows:

$$
\begin{aligned}
2 w+3 c & =650 \\
+3 w+c & =450 \\
\hline 5 w+4 c & =1,100
\end{aligned}
$$

Since the question asks for the price of five wooden skateboards and four composite skateboards, the answer is (D).
13. D The question states that the number of employees increases at the same rate per year, so you can determine this numerical increase by subtracting one year's total from the next year's total. Subtracting the 2013 total from the 2014 total gives $2,110-1,890=220$. To find the total in 2015, add 220 to the 2014 total: $2,110+220=2,330$. The question also states that the male percentages continue to decrease at the same rate, which, based on the data in the table, is $5 \%$ per year. The percent male in 2014 was $55 \%$, so the percent male in 2015 will be $50 \% .50 \%$ of 2,330 can be expressed as or $\frac{50}{100}(2330)=1,165$, which is (D).
14. B The formula for determining an average can be expressed by Average $=$ $\frac{\text { Total }}{\# \text { of things }}$. Plug the values provided into the equation as follows: $11=$ $\frac{4+5+11+13+16+18+x}{7}$, or $11=\frac{67+x}{7}$. Multiply both sides by 7 to get $77=$ $67+x$. Subtract 67 from both sides to get $x=10$, which is (B).
15. C There are a variety of ways to approach this question. You could solve one equation for $s$ or $t$ and substitute it into the other equation, but look to see if you can do it more simply by stacking and adding (or subtracting) the equations. If you double the first equation to get $34 s+40 t=118$, you can then stack and subtract the equations to eliminate $t$ and solve for $s$, as follows:

$$
\begin{aligned}
34 s+40 t= & 118 \\
-(30 s+40 t & =110) \\
\hline 4 s & =8
\end{aligned}
$$

So, $4 s=8$ and therefore $s=2$. Now plug in 2 for the value of $s$ in one of the equations: $30(2)+40 t=110$, so $40 t=110-60$, so $40 t=50$ and $t=\frac{5}{4}=1.25$.

Next, plug $s=2$ into the answer choices to determine which one matches your target of 1.25 : (C), $\frac{5}{2 s}=\frac{5}{2(2)}=\frac{5}{4}=1.25$.
16. A The best way to approach this question is through POE. Choice (A) states that the majority of students polled logged in more times than they posted. The values along the $x$-axis of the graph are, for most of the data points, higher than the values along the $y$-axis of the graph, and thus (A) is true according to the data provided. This same data contradicts (B) and (C). You can eliminate (D) because the data does, in fact, allow you to draw a conclusion about the relationship between the variables.
17. B Don't get too thrown off by the graph. All you need to know to solve this question is that perpendicular lines have slopes that are the negative reciprocals of each other. Since the standard equation for a line is $y=m x+b$, the slope of the $f(x)$ line is 3 . The slope of the $h(x)$ line must therefore be $-\frac{1}{3}$. The only answer choice that matches is (B).
18. C The best way to deal with this question is to Plug in the Answers (PITA), starting with (A). If $x=6$, then $y=3^{6}=729$. This is less than 4,000 , so eliminate (A) and move to the next answer choice. If $x=7$, then $y=3^{7}=2,187$. This is still less than 4,000 , so eliminate (B). If $x=8$, then $y=3^{8}=6,561$. This is greater than 4,000 , so (C) must be the correct answer.
19. D The first step here is to simplify the equation and solve for $a$. Start by multiplying both sides by 16 to get $16 a=4 a^{2}$. Divide both sides by 4 to get $4 a=$ $a^{2}$. Divide both sides by $a$ to get $4=a$. This is now your target answer. Plug $a=$ 4 into the values of $a$ in the answer choices to determine which one matches 4 . Choice (D) is the answer, since $2 \sqrt{a}=2 \sqrt{4}=2(2)=4$.
20. B Since work $=$ rate $\times$ time, the 280 in the equation must represent the total number of meals (i.e. the "work"). All three chefs are working together, so they work for the same amount of time, and $x$ must represent that time. The coefficients 8,4 , and 2 must therefore represent the chefs' respective rates, or how many meals each prepares in a set amount of time. Since 8 is the greatest
of these three coefficients, $8 x$ must be the meal output of the fastest chef, either (B) or (C). Now you need to solve the equation: $8 x+4 x+2 x=28$. Combining like terms gives you $14 x=280$. Divide both sides by 14 to determine that $x=20$. This number represents the amount of time that the chefs worked, so the actual number of meals prepared by the fastest chef would be $8 \times 20=160$ meals, which is (B).
21. D Start by finding the slope of the line provided on the graph using the points ( o , $-4)$ and (6,0) and the point-slope formula: $\frac{y_{2}-y_{1}}{x_{2}-x_{1}}=\frac{0-(-4)}{6-0}=\frac{4}{6}=\frac{2}{3}$. When this line is reflected across the line $y=x$, the $x$ and $y$ values switch, so the new slope would be the reciprocal of the original slope. Since our original slope was $\frac{2}{3}$, our new slope will be $\frac{3}{2}$. The numerator here reflects the gain or loss of pieces of fruit in the harvest, and the denominator reflects the nutrients subtracted or added. This means that for every two nutrients added, there will be a harvest gain of three pieces of fruit, which is (D).
22. D The issue that needs clarification here is whether the students polled by Joe thought that a score of 1 or a score of 5 was good. Since (A) and (C) deal with George's poll, they would do nothing to help clarify this ambiguity. Choice (B) might help us to figure out which of the students Joe polled were interested in the Model UN Club; it would not help to determine whether 1 or 5 was the best rating. Choice (D) is thus the best answer.
23. C In order to determine the normal cost for renting skis and snowboards, you need to write two equations and then manipulate and solve those equations. If you call skis $x$ and snowboards $y$, your two equations will be $5 x+2 y=370$ and $3 x+4 y=390$. Look for a way to stack and add the equations to eliminate one of the variables. For instance, multiply the first equation by 2 to get $10 x+4 y=$ 740, and then stack and subtract the equations, as follows:

$$
\begin{aligned}
10 x+4 y & =740 \\
-\quad(3 x+4 y & =390) \\
\hline 7 x & =350
\end{aligned}
$$

So, $7 x=350$ and $x=50$, so the price of a pair of skis is $\$ 50$. Plug this number back into either equation to find the cost of a snowboard: $10(50)+4 y=740$, so $4 y=740-500$ and $4 y=240$. Therefore, $y=60$, the cost of a snowboard. So, the cost of two pairs of skis and two snowboards would normally be $2(50)$ $+2(60)=100+120=220$. Finally, remember that prices are discounted by $10 \%$, so multiply the price of $\$ 220$ by $10 \%$ to get $\$ 22$, and subtract $\$ 22$ from the price. The final cost of two pairs of skis and two snowboards is $220-22=$ 198, which is (C).
24. A Start by simplifying $8 x+8 y=18$ by dividing each term by $8: x+y=\frac{18}{8}$ or : $x+$ $y=\frac{9}{4}$. The second equation provided in the question can be factored: $x^{2}-y^{2}$ is the same as $(x+y)(x-y)$, so the second equation can also be written $(x+y)(x$ $-y)=-\frac{3}{8}$. Since you know that $x+y=\frac{9}{4}$, you can rewrite the second equation as $\frac{9}{4}(x-y)=-\frac{3}{8}$. Multiply both sides by : $\frac{4}{9}: x-y=-\frac{3}{8}\left(\frac{4}{9}\right)$ or $x-y=-\frac{1}{6}$. Since the question asks for the value of $2 x-2 y$, simply multiply everything by $2: 2(x$ $-y)=2\left(-\frac{1}{6}\right)=-\frac{1}{3}$, which is (A).
25. D If each minute of his workout time burns 50 calories, and he wants to consume no fewer than 2,000 calories, Shaun must work out for a minimum of $\frac{2,000}{50}=40$ minutes. If he wants to consume no more than 2,500 calories, Shaun must work out for a maximum of $\frac{2,000}{50}=50$ minutes. Since the question asks for the inequality that represents the number of minutes for which Shaun will burn off as many calories as he consumes, (D) is correct, as it includes both the minimum ( 40 minutes) and maximum ( 50 minutes) amount of time that he can work out. Choice (C) is incorrect because the answer should include 50 (he can work out for a "maximum" of 50 minutes, so he could work out for 50 minutes), but the lesser than sign ("<") excludes 50.
26. A There are 162 games in the season, so the team needs a total of $162 \times 45,500=$ $7,371,000$ ticket purchases to have a mean of 45,500 ticket purchases per game for the season. The 60 games with an average total ticket purchase of 43,000 gives a total of $2,580,000$ ticket purchases, leaving 4,791,000 ticket purchases left for the team to reach its goal. Dividing $4,791,000$ by 102 makes (A) the closest value to the average of 46,971 ticket purchases per game the team needs to make.
27. B The best way to deal with this question is through POE. If the polynomial has zeroes of 2 and -3 , then that means you have two points: $(2,0)$ and $(-3,0)-$ eliminate (A) and (C). Since it is given in the question that $a>0$ when the parabola is in the form $y=a x^{2}+b x+c$, the parabola must be pointed upwards -eliminate (D) and choose (B).
28. A Since the radius of the circle is 4 , the area of the entire circle is $\pi r^{2}=\pi\left(4^{2}\right)=$ $16 \pi$. Sector $P O R$ has an area of $8 \pi$ and sector $R O Q$ has an area of $6 \pi$, so the remaining sector (QOP) has an area of $16 \pi-8 \pi-6 \pi=2 \pi$. You can set up a proportion to determine the associated angle using the following formula: $\frac{\text { sector area }}{\text { total area }}=\frac{\text { sector angle }}{360^{\circ}}$. Using the numbers you now have, your calculation will look like this: $\frac{2 \pi}{16 \pi}=\frac{\text { sector angle }}{360^{\circ}}$ or $\frac{1}{8}=\frac{\text { sector angle }}{360}$. Multiply both sides of the equation by 360 to determine that the sector angle is $45^{\circ}$, which is (A).
29. D $16 \%$ of the 200 medical residents named oncology as their first choice: $\frac{16}{100}$ (200) or (0.16)(200) $=32$ residents. $40 \%$ of the 200 medical residents named cardiology as their first choice: $\frac{40}{100}(200)$ or $(0.4)(200)=80$ residents. Of these 80 residents, $20 \%$ chose oncology as their second choice: $\frac{20}{100}(80)$ or $(0.2)(80)=16$ residents. The total number of residents who named oncology as either their first or second choice was therefore $32+16=48$ residents. To find the value of $x$, you need to subtract the percentages given in the question
from the total, $100 \%$ : $100-40-16-34=x=10 \%$. Now, plug $x=10$ into the answer choices in order to determine which one matches your target of 48 residents. Only (D) works: $x^{2}-24 x+188=100-24(10)+188=100-240+$ $188=48$.
30. B If the original graph is reflected across the $x$-axis, the $x$-values will remain the same but the $y$-values will switch signs. Since the $y$-axis represents distance from start, negative $y$-values means that the car is now going in reverse. The only answer that matches this information is (B).
31. 30 Translate English to math. "What number divided by two is equal to that same number minus 15 ?" can be written as an equation, with $x$ representing the missing number: $\frac{x}{2}=x-15$. Add 15 to both sides of the equation to get $\frac{x}{2}+15$ $=x$. Subtract $\frac{x}{2}$ from both sides to get $15=\frac{x}{2}$. Multiply both sides by 2 to get $x$ $=30$.
32. 4 When dealing with values that are directly proportional, you can use the equation $\frac{x_{1}}{y_{1}}=\frac{x_{2}}{y_{2}}$. For this question, you can call the number of hours spent playing Call of Destiny $x$ and the number of hours spent in the game room $y$. Your equation will then look like this: $\frac{6}{8}=\frac{3}{y_{2}}$. Cross-multiply to get $6 y_{2}=3(8)$ or $6 y_{2}=24$. Divide both sides of the equation by 6 to get $y_{2}=4$.
33. 13.5 Start by translating English to math. Make $s$ the price of Smooth-Glide pens and $e$ the price of Easy-Write pencils. If 12 pens and 8 pencils cost $\$ 16$, then $12 S+8 e=16$. Similarly, if 6 pens and 10 pencils cost $\$ 11$, then $6 s+10 e=11$. Remember to Read the Full Question! The question wants the price of 9 pens and 9 pencils. If you stack the equations and add, you get $18 s+18 e=27$. This is exactly double the number of pens and pencils you want, so divide the entire equation by 2 to get $9 s+9 e=13.5$.
34. 2 or $\frac{10}{3}$

There are a few different ways to approach this question. Since the calculator is permitted on this section of the test, you can put the equation into the standard $a x^{2}+b x+c=0$ form and plug that equation into the " $y=$ " button on your graphing calculator. The equation, once rearranged, is $3 x^{2}-16 x+20=0$. You can trace the graph or use the "calc" feature to calculate the zeroes, which are the same as the values of $x$. Doing so will yield values of $x=2$ and $x=3.33$. Alternatively, you can factor the equation the long way or use the quadratic formula, $\frac{-b \pm \sqrt{b^{2}-4 a c}}{2 a}$. In this equation, $a=3, b=-16$, and $c=20$. Plugging those values into the equation, you get $\frac{-(-16) \pm \sqrt{(-16)^{2}-4(3)(20)}}{2(3)}=\frac{16 \pm \sqrt{16}}{6}=\frac{16 \pm 44}{6}$. Therefore, the solutions are $\frac{16+4}{6}=\frac{20}{6}=\frac{10}{3}$ and $\frac{16-4}{6}=\frac{12}{6}=2$. Either value $\left(\frac{10}{3}\right.$ or 2$)$ is a valid answer.
35. 5 Since you are looking for the value of $x$ for which the population surpassed the number of dwellings, you can set up an inequality: $3^{x}>2 x+100$. Now, simply plug in values for $x$ starting with $x=1$ until the left-hand side of the inequality is larger than the right-hand side. Using the values $x=1, x=2, x=3$, and $x=4$, you will find that the left-hand side of the inequality is less than the righthand side. Using $x=5,3^{5}=243$, and $2(5)+100=110$, making the left-hand of the inequality greater than the right-hand side. Therefore, the answer is 5 .
36. 5,406 The first step here is to add Team Charlie's and Team Delta's total currents together as follows:

$$
\begin{array}{r}
50+12 i \\
+\quad 40-9 i \\
\hline 90+3 i
\end{array}
$$

Next, use FOIL to multiply this value by the total current from Team Epsilon: $(90+3 i)(60-2 i)=5,400-90(2 i)+60(3 i)-2 i(3 i)=5400-180 i+180 i-$
$6 i^{2}=5,400-6 i^{2}$. Since $i^{2}=-1$, this is equivalent to $5,400-6(-1)=5,400+6$ $=5,406$. If you have a calculator that is able to deal with imaginary numbers, you can simply type the expressions into your calculator, which will solve everything for you.
37. 860 The question states that there are 2,400 total inhabitants of Centre Hill, so if there are an equal number of adults and children, then there are 1,200 of each. Since there are 200 more adult females than adult males, you can set up two equations: $f+m=1,200$ and $f=m+200$. You can rewrite the second equation by subtracting $m$ from both sides: $f-m=200$. Next, stack and add the two equations as follows:

$$
\begin{aligned}
f+m & =1,200 \\
+\quad f-m & =200 \\
\hline 2 f \quad & =1,400
\end{aligned}
$$

Divide both sides of the equation by 2 to determine that $f=700$. The number of women living uptown is therefore $8 \%$ of $700: \frac{8}{100}(700)$ or $(0.08)(700)=56$. The number of children living in the suburbs is $67 \%$ of $1,200: \frac{67}{100}(1,200)$ or $(0.67)(1,200)=804$. The sum of these two figures is $56+804=860$.
38. 250 Using your information from question 37, you can determine that the total number of adult males prior to the addition of the annex is $1,200-700=500$. The original percentage of adult males living Uptown is $9 \%$ of $500: \frac{9}{100}(500)$ or $(0.09)(500)=45$. Since the question states that the percentage of adult males living Uptown decreases to $6 \%$, you can conclude that the 45 adult males living Uptown after the annexation constitute $6 \%$ of the total adult male population: $45=\frac{6}{100}(x)$ or $45=(0.06) x$. Divide both sides of the equation by 0.06 to determine that $x=750$. Since the original number of adult males was $500,750-500=250$ additional adult males live in The Annex.

## Chapter 24 <br> Practice Test 3

## [3]

By the twentieth century, however, bed bugs were seen to be the nuisance that 38 they are. This was in part due to 39 there prevalence: in 1933, the UK Ministry of Health reported that all the houses in many areas of the country had some bed-bug infestation. Military bases during World War II had significant problems with bedbug infestation as the bugs appeared all over Europe.

## [4]

With increased public awareness and some advances in pesticides, bed bugs were nearly eradicated from the United States in the 1940s, though they reemerged as an urban menace in the 1980s. 40 No one is entirely clear on the reason, though scientists hypothesize that the resurgence of bed bugs is due to increased pesticide 41 resistants and international travel. The nuisance is now treated 42 locally. Though the lifespan and long dormancy of the bed bugs have led many to believe that the problem may be a permanent one.

## 38

A) NO CHANGE
B) it is.
C) some can be.
D) they are known to be.
A) NO CHANGE
B) they're
C) their
D) the

40
With the preceding sentence, the writer intended to introduce this paragraph in a way that established continuity with the previous paragraph. Has the writer achieved this goal?
A) Yes, because the previous paragraph addresses the resurgence of bed bugs in the later part of the century.
B) Yes, because the previous paragraph suggests an earlier moment chronologically.
C) No, because there is no mention of the 1940s or the 1980s in the previous paragraph.
D) No, because this paragraph doesn't mention anything about military bases or wartime incidences.

41
A) NO CHANGE
B) resistance
C) resistivity
D) resisting

42
A) NO CHANGE
B) locally; though
C) locally, and
D) locally, though

## [5]

Today, bed bugs are still mainly considered a nuisance. They cost renters and owners millions of dollars each year in exterminator fees and infested furniture replacement. But a recent study has shown that we may have a new reason to worry about the bugs. Now, some research has shown that bed bugs can transmit disease, a practice of which they were long believed incapable. A study documented in the American Journal of Tropical Medicine and Hygiene showed that bed bugs could transmit Chagas disease between mice, 43 which many $\underline{\text { objected to as being inhumane. }}$

## [6]

If these findings are true, then bed bugs may be a more significant public health threat than was previously believed. Like mosquitoes in malaria-ridden countries, bed bugs may be redefined as a true menace, rather than just an itchy nuisance. 44

## 43

Which of the following true choices would best maintain the focus of this sentence and paragraph?
A) NO CHANGE
B) which are often used in laboratory tests.
C) though not in rats, whom they haven't tested.
D) which is really startling.

44
The best placement for paragraph 6 would be
A) where it is now.
B) after paragraph 2 .
C) after paragraph 3 .
D) after paragraph 4.

# Math Test - No Calculator <br> 25 MINUTES, 20 QUESTIONS 

Turn to Section 3 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-15, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 16-20, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 16 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is not permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$V=l w h$

$V=\pi r^{2} h$

$V=\frac{4}{3} \pi r^{3}$

$V=\frac{1}{3} \pi r^{2} h$

$V=\frac{1}{3} \ell w h$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

Marco is ordering salt, which is only sold in 30-pound bags. He currently has 75 pounds of salt, and he needs to have a minimum of 200 pounds. Which of the following inequalities shows all possible values for the number of bags, $b$, that Marco needs to order to meet his minimum requirement?
A) $b \geq 4$
B) $b \geq 5$
C) $b \geq 6$
D) $b \geq 7$

A website hopes to sign up 100,000 subscribers. So far, the website has signed up an average of 500 subscribers per day for $d$ days. Which of the following represents the number of additional subscribers, $W$, the website must sign up to reach its goal?
A) $W=500 d$
B) $W=99,500 d$
C) $W=100,000-500 d$
D) $W=100,000+500 d$

If $f$ is a function and $f(4)=5$, which of the following CANNOT be the definition of $f$ ?
A) $f(x)=x+1$
B) $f(x)=2 x-3$
C) $f(x)=3 x-2$
D) $f(x)=4 x-11$

4
Which of the following is equivalent to the expression
$\frac{x^{3}+x^{2}}{x^{4}+x^{3}}$ ?
A) $\frac{x^{5}}{x^{7}}$
B) $\frac{2}{x}$
C) $\frac{5 x}{7 x}$
D) $x^{-1}$

5
Régine is measuring how many solutions from Batch $x$ and Batch $y$ are acidic. She measured a total of 100 solutions from both batches. $40 \%$ of the solutions from Batch $x$ and $70 \%$ of the solutions from Batch $y$ were acidic, for a total of 48 acidic solutions. Solving which of the following systems of equations yields the number of solutions in Batch $x$ and Batch $y$ ?
A) $x+y=100$

$$
0.4 x+0.7 y=48
$$

B) $\quad x+y=48$

$$
0.4 x+0.7 y=100
$$

C) $\quad x+y=100 \times 2$ $0.4 x+0.7 y=48$
D) $\begin{aligned} x+y & =100\end{aligned}$ $40 x+70 y=48$

6

Which of the following equations best describes the figure above?
A) $y=-x^{4}+6$
B) $y=-\left(x^{2}+6\right)$
C) $y=-x^{2}+6$
D) $y=x^{4}+6$

7
The price of an item that cost $\$ 43$ in 2010 always increases by $\$ 3$ per year. The current price in dollars, $P$, of the item can be represented by the equation $P=3 t+10$, where $t$ is the number of years since the item was first manufactured. Which of the following best explains the meaning of the number 10 in the equation?
A) It is the price of the item in 1999.
B) It is the price of the item in 2000.
C) It is the price of the item in 2001.
D) It is the annual increase in the price of the item.

8

In the circle with center $O$ and radius 10 shown above, $\angle A O B=\frac{2 \pi}{5}$. What is the length of minor $\operatorname{arc} A B$ ?
A) $\pi$
B) $2 \pi$
C) $4 \pi$
D) $20 \pi$

## 9

Clark's Rule is a formula used to determine the correct dosage of adult over-the-counter medicine a child can receive. The child's weight, in pounds, is divided by 150 , and the result is multiplied by the adult dose of the medicine. A mother needs to give her daughter acetaminophen, which has an adult dose of 1,000 milligrams. She does not know her daughter's exact weight, but she knows the weight is between 75 and 90 pounds. Which of the following gives the range of correct dosage, $d$, in milligrams of acetaminophen the daughter could receive?
A) $50<d<60$
B) $500<d<600$
C) $1,000<d<1,200$
D) $1,600<d<2,000$

Ohm's Law, which can be written as $I R=V$, relates the current $I$ in amperes that flows through a conductive material with resistance $R$ ohms to the voltage $V$
between the two ends. The power $P$ in watts can be related to $I$ and $R$ by the equation $I=\sqrt{\frac{P}{R}}$. Which of the following gives $P$ in terms of $V$ and $R$ ?
A) $P=\frac{R}{V^{2}}$
B) $P=\frac{V}{R}$
C) $P=\frac{V^{2}}{R}$
D) $P=V^{2} R^{3}$

Note: Figure not drawn to scale.
In the figure above, $\angle A B C \cong \angle C D E$. Which of the following is true?
A) $\overline{A B} \| \overline{C D}$
B) $\overline{B C} \| \overline{A E}$
C) $\overline{C D} \| \overline{A E}$
D) $\overline{B C} \cong \overline{A E}$

13
For which of the following values of $w$ does
$\sqrt[4]{16 w^{3} x^{\frac{9}{w}}}=(2)\left(3^{\frac{3}{4}}\right)\left(x^{\frac{3}{4}}\right) ?$
A) 2
B) 3
C) 4
D) 6

14
If $r=\left(\frac{1}{2} a+b\right)^{2}$ and $s=-4 a b+3 b$, what is $r-2 s$ in terms of $a$ and $b$ ?
A) $\frac{1}{4} a^{2}+b^{2}-7 a b-6 b$
B) $\frac{1}{4} a^{2}+b^{2}-7 a b+6 b$
C) $\frac{1}{4} a^{2}+b^{2}+9 a b-6 b$
D) $\frac{1}{2} a^{2}+b^{2}+9 a b-6 b$

15
Which of the following lines contains all points equidistant from the points $(0,4)$ and $(8,0)$ in the $x y$ plane?
A) $2 y=-x+8$
B) $2 y=x$
C) $y=2 x-6$
D) $y=-2 x$

16

$$
\begin{aligned}
& \frac{p}{3}+\frac{q}{2}=1 \\
& p-3 q=1
\end{aligned}
$$

Based on the system of equations above, what is the value of $p$ ?

17

$$
\begin{aligned}
y & =x \\
(y-2)^{2}-4 & =-x
\end{aligned}
$$

The system of equations above intersects at two points. What is the sum of the coordinates of the point of intersection in quadrant I?

18

$$
1<(c-1)^{2}<36
$$

What is the greatest integer solution to the inequality above?

19

$$
\begin{gathered}
2 y-x \leq 4 \\
-2 x+y \geq-4
\end{gathered}
$$

If $s$ is the sum of the $x$ - and $y$-coordinates of any point in the solution to the system of inequalities above as graphed in the $x y$-plane, what is the greatest possible value of $s$ ?

20
Squares $A B C D$ and $W X Y Z$ define two parallel planes such that $A W=B X=C Y=D Z=5$. Additionally, $A B=W X=4$. Point $Q$ lies between the two parallel planes such that it is equidistant from points $A, B, C$, and $D$ and also equidistant from points $W, X, Y$, and $Z$. Lines $A Q Y, B Q Z, C Q W$, and $D Q X$ are drawn to create two pyramids. What is the total volume of the two pyramids?

## Math Test - Calculator

## 55 MINUTES, 38 QUESTIONS

Turn to Section 4 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-30, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 31-38, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 31 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$V=l w h$

$V=\pi r^{2} h$

$V=\frac{4}{3} \pi r^{3}$

$V=\frac{1}{3} \pi r^{2} h$

$V=\frac{1}{3} \ell w h$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180 .

An air pump at a gas station dispenses 90 pounds of air for $\$ 0.25$. Which of the following expressions gives the number of pounds of air dispensed, $P$, for $d$ dollars?
A) $P=d+90$
B) $P=d+360$
C) $P=90 d$
D) $P=360 d$

Taylor is 6 feet tall. If 1 foot is equal to approximately 0.3 meters, then which of the following is closest to Taylor's height in meters?
A) 1.8
B) 2
C) 18
D) 20

A developer is creating a plan for a 44 -acre park that includes a 4 -acre lake that cannot be developed. If 8 to 10 acres, inclusive, must be reserved for soccer fields, which of the following inequalities shows all possible values for $p$, the amount of land that within the park that is available for development?
A) $26 \leq p \leq 40$
B) $30 \leq p \leq 32$
C) $34 \leq p \leq 36$
D) $36 \leq p \leq 40$

4
Fuel Efficiency by Vehicle Weight

The scatterplot above shows the fuel efficiency, in miles per gallon, of a variety of vehicles weighing between 1.5 and 4 tons. Based on the line of best fit to the data represented, which of the following is the closest to the expected miles per gallon of a vehicle that weighs 3 tons?
A) 20
B) 24
C) 27
D) 28

5
White-Nosed Coati Population in Tikal National Park

As part of a recent wildlife conservation effort in Guatemala, park rangers in Tikal National Park have tracked the growing number of white-nosed coati living within a certain protected region over the period 1994-2004.

According to the data above, if the population of coati in the protected region of Tikal National Park increased at the same rate from 2004-2006 as it did from 2000-2004, then what was the number of coati in the park in 2006?
A) 180
B) 190
C) 200
D) 210

6

$$
\frac{8 d+10-d}{3}=\frac{d(3+4)+a}{3}
$$

If the equation above has infinitely many solutions for $d$, what is the value of $a$ ?
A) -10
B) 10
C) $\quad 15$
D) 20

Maggie's and Glenn's Distances from Home During Jog

Maggie and Glenn both leave from the same house to go for a jog along a trail. Shortly after leaving, Maggie realizes she forgot her iPod and returns home to find it before heading back out onto the same trail. The graph above shows how far each of them is from home for the first fifteen minutes of their jogs.

What is Glenn's approximate average speed in meters per second for the portion of his jog shown?
A) 3.3
B) 15
C) 200
D) 12,000

4

8
Environmentalists have been monitoring the area of a glacier in Canada. The glacier is slowly shrinking. The glacier originally occupied 15,000 square miles, but after two years of monitoring the glacier, the scientists document that the area of the glacier is now 14,910 square miles. If $y$ is the number of years since monitoring began, which equation best describes the glacier's area, $G(y)$, as a function of time?
A) $G(y)=15,000 \frac{1}{y}$
B) $G(y)=15,000(0.003)^{y}$
C) $G(y)=15,000(0.997)^{y}$
D) $G(y)=0.997^{y}$

9
Mike consumes an average of 1,680 calories per day. Each day he has finals, Mike consumes $12 \%$ more calories per day than he usually does. During the last day of finals, he celebrates by consuming an additional 900 calories. Which of the following represents the total number of calories Mike consumes during $d$ days of finals?
A) $1.12(1,680 d+900)$
B) $1.12(1,680 d)+900$
C) $1.12(1,680+900) d$
D) $(1,680+0.12 d)+900$

The varsity swim team at Northwest High is planning a team trip and needs to choose between Austin, TX, and Pensacola, FL. The team takes a vote and the results of the vote are shown in the table below.

|  | Juniors | Seniors |
| :--- | :---: | :---: |
| Austin, TX | 14 | 19 |
| Pensacola, FL | 7 | 23 |

Given the information shown above, which of the following statements is true?
A) The number of juniors that prefer Pensacola, FL, is twice the number of juniors that prefer Austin, TX.
B) The seniors are more than three times as likely to prefer Pensacola, FL, than are the juniors.
C) The number of seniors that prefer Austin, TX, is $5 \%$ more than the number of juniors that prefer Austin.
D) One-third of the juniors prefer Pensacola, FL.

11
The 2013 U.S. Census recorded the highest educational attainment of all adults aged 25 years or older in county $T$, one of the most educated parts of the country. The results are given in the two-way table below.

|  | Men | Women | Total |
| :--- | :--- | :--- | :--- |
| High School Diploma | 7,535 | 7,234 | 14,769 |
| Bachelor's Degree | 17,170 | 23,455 | 40,625 |
| Master's Degree | 45,105 | 41,078 | 86,183 |
| Professional Degree | 23,501 | 23,405 | 46,906 |
| Doctoral Degree | 16,232 | 15,817 | 32,049 |
| Total | 109,543 | 110,989 | 220,532 |

According to the data presented in the table above, if you were to choose a person at random out of the entire population aged 25 years or older in county $T$, what is the approximate probability that the person you chose is a man with a doctoral degree (given as a percent)?
A) $2 \%$
B) $7 \%$
C) $28 \%$
D) $51 \%$

## 12

The cost in dollars, $C$, of producing a custom-made T-shirt with a team logo is given by the formula $C=110+\frac{x}{2}$, where $x$ is the number of T-shirts produced. When every T-shirt produced is sold, the revenue from selling the customized T -shirts is given by $R=15 x-\frac{x^{2}}{10}$. Which one of the following would be the formula for the profit from producing and selling $x$ T-shirts?
(Profit $=$ Revenue - Cost $)$
A) $-\frac{x^{2}}{10}-\frac{31}{2} x+110$
B) $-\frac{x^{2}}{10}-\frac{29}{2} x+110$
C) $-\frac{x^{2}}{10}+\frac{29}{2} x-110$
D) $-\frac{x^{2}}{10}+\frac{31}{2} x-110$

While on vacation in Morocco, Erik decided to splurge on a fancy hotel that cost 2,000 Moroccan dirhams per night. If he stayed in that particular hotel for three nights, but his bank only lets him withdraw $\$ 200$ at a time, how many visits to the ATM must Erik have made in order to cover the cost of his hotel stay?
(Note: 1 Moroccan dirham $=\$ 0.11$ )
A) 1
B) 2
C) 3
D) 4

4

14
Peter's Petrol Station is selling regular unleaded gas for $\$ 3.49$ a gallon and premium gas for $\$ 3.79$ a gallon. If a car wash is purchased, then a discount of $\$ 0.10$ per gallon is applied. During one morning, a total of 850 gallons of gas was sold, and 100 gallons were sold at the discounted rate. The total collected in sales was $\$ 3,016.50$. Solving which of the following systems of equations yields the number of regular unleaded gallons of gas, $u$, and the number of premium gallons of gas, $p$, that were sold during that morning?
A) $u+p=850$
$3.49 u+3.79 p=301.65$
B) $u+p=850$
$3.49 u+3.79 p=3,016.50$
C) $\quad u+p=850$

$$
3.49 u+3.79 p=3,026.50
$$

D) $u+p=3,016.50$
$3.49 u+3.79 p=850$

15
Of the 784 juniors and seniors at Abingdon High School, 319 are currently enrolled in one or more Advanced Placement (AP) courses. Of these AP students, 75 are enrolled in AP Biology, 58 are enrolled in AP U.S. History, and 22 are enrolled in both AP Biology and AP U.S. History. Approximately what percent of the juniors and seniors at Abingdon High School are enrolled in AP courses other than Biology and U.S. History?
A) $17 \%$
B) $27 \%$
C) $37 \%$
D) $47 \%$

To receive a B in his chemistry class, Mateo needs to earn an average score from 80 to 89 , inclusive. His grade is based only on 3 tests. The highest possible score on each of these tests is 100 points. He scored 79 on his first test and 95 on his second test. If $y$ represents his score on the third test, which of the inequalities below shows all values of $y$ that would earn Mateo a B in his chemistry class?
A) $66 \leq y \leq 93$
B) $66 \leq y \leq 100$
C) $80 \leq y \leq 89$
D) $80 \leq y \leq 93$

$$
Y=\frac{A}{A+W}
$$

A gardener prepares a mixture of fertilizer with concentration, by volume, equal to $Y$. It is prepared by mixing a volume of fertilizer given by $A$ with a volume of water given by $W$. The expression above represents the mixture described. What physical quantity does the term $A+W$ represent in the equation above?
A) The volume of the mixture
B) The mass of fertilizer added
C) The volume of the fertilizer in the mixture
D) The concentration of the fertilizer

4

18
Two groups of subjects are combined in a psychological research experiment. The mode score for group A is 7 and the mode score for group B is 6 . Which of the following conclusions can be made?
A) The mode for the whole group is 6 .
B) The mode for the whole group is between 6 and 7 .
C) The mode for the whole group is 7 .
D) The mode cannot be determined from the given information.

19
The map below shows the layout of streets in a city and the location of several places. Each horizontal or vertical line between two adjacent streets represents a city block, and each city block represents 0.6 miles.

Josh needs to drive from Kelly's Kitchen to Gary's Grocery. If Josh drives the shortest distance possible on the roads shown above at a constant speed of 30 miles per hour, how long does it take him to make the trip from Kelly's Kitchen to Gary's Grocery?
A) 6 minutes
B) 10 minutes
C) 12 minutes
D) 20 minutes

20

$$
\begin{aligned}
& 2 s-\frac{1}{3} t=10 \\
& 5 s=t+12-s
\end{aligned}
$$

Which of the following is a true statement about the system of equations above?
A) There are infinitely many solutions to the system of equations.
B) When the system is solved for $s$, the result is 5 .
C) When the system is solved for $t$, the result is 6 .
D) There are no solutions to the system of equations.

The student council at Shermer High School wants to use student opinion to decide on one of three possible homecoming themes for the year. President Peterson thinks that the best way to determine popular opinion is for each of the 10 members of the student council to poll 10 of their friends and select the theme that receives the most votes. Vice President Vaidya wants to go to the cafeteria during lunch and poll 100 students to determine the winner. Treasurer Thompson says the best method would be to assign numbers to each of the 1,000 students in the school, randomly select 100 of them to poll, and select the winner based on the results. Secretary Stephens argues that they must poll each of the 250 members of the senior class to find the most popular theme. Whose method is most likely to accurately determine overall student opinion regarding the most popular homecoming theme?
A) President Peterson
B) Secretary Stephens
C) Treasurer Thompson
D) Vice-President Vaidya

22
Is the point $(-2,-2)$ located inside, on, or outside the circle with equation $(x+3)^{2}+(y-1)^{2}=9$ ?
A) Inside the circle
B) On the circle
C) Outside the circle
D) It cannot be determined from the given information.

23
If the expression $\frac{x-12}{\sqrt{8}}$ is most nearly equal to $\frac{x \sqrt{2}}{4}-C$, then what is the value of $C$ ?
A) -3
B) $-\sqrt{3}$
C) 2
D) $3 \sqrt{2}$

A survey was conducted among a randomly chosen sample of full-time salaried workers about satisfaction in their current jobs. The table below shows a summary of the survey results.

Reported Job Satisfaction by Education Level (in thousands)

| Highest Level <br> of Education | Satisfied | Not <br> Satisfied | No <br> Response | Total |
| :--- | :--- | :--- | :--- | :--- |
| High School Diploma | 17,880 | 12,053 | 2,575 | 32,508 |
| Bachelor's Degree | 24,236 | 8,496 | 3,442 | 36,174 |
| Master's Degree | 17,605 | 5,324 | 1,861 | 24,790 |
| Doctoral Degree | 12,210 | 2,081 | 972 | 15,263 |
| Total | 71,931 | 27,954 | 8,850 | 108,735 |

Of the people whose highest level of education was a bachelor's degree who reported job satisfaction, 1,000 people were randomly selected to complete a followup survey in which they were asked about their salary satisfaction. There were 658 people in this follow-up sample who said that they were satisfied with their salaries, and the other 342 people were not satisfied. Using the data from both the initial survey and the follow-up survey, which of the following statements is most likely true?
A) Approximately 16 million people with bachelor's degrees would report salary satisfaction.
B) Approximately 24 million people with bachelor's degrees would report salary satisfaction.
C) Approximately 47 million people with bachelor's degrees would report salary satisfaction.
D) Approximately 72 million people with bachelor's degrees would report salary satisfaction.

25
Line $d$ has a slope of $\frac{4}{5}$ and passes through the point $(1,1)$. Line $e$ is parallel to line $d$ and has a $y$-intercept 3 times that of line $d$. Which of the following is the equation of line $e$ ?
A) $5 y-4 x=3$
B) $5 y-x=4$
C) $10 y-8 x=30$
D) $20 y+25 x=12$

26

$$
\frac{q^{2}-q-42}{q+6}=\sqrt{q-5}
$$

The equation above can be solved for two solutions, one of which is extraneous. What is the value of the extraneous solution?
A) 5
B) 6
C) 8
D) 9

## 27

A gaming company conducted a study to find out what age groups preferred which types of games. The table below outlines the survey results.

| Age Group | First <br> Person <br> Shooters | Sports <br> Games | Adventure <br> Games | Total |
| :--- | :--- | :--- | :--- | :--- |
| 9- to 13-year olds | $16,000,000$ | $9,000,000$ | $25,000,000$ | $50,000,000$ |
| 14- to 18-year olds | $48,000,000$ | $13,000,000$ | $31,000,000$ | $82,000,000$ |
| 19- to 22-year olds | $38,000,000$ | $27,000,000$ | $19,000,000$ | $84,000,000$ |
| 23- to 60 -year olds | $8,000,000$ | $3,000,000$ | $10,000,000$ | $21,000,000$ |

According to the information provided in the table, the gaming company concludes that if they can double the number of 19- to 22-year olds playing sports games, and increase the number of sports gamers in the 9- to 13-year old age group, they will have equal total numbers of players for each game type if they double the number of players of adventure games in which age group?
A) 23- to 60-year olds
B) 19- to 22-year olds
C) 14- to 18-year olds
D) 9- to 13-year olds

28

$$
V(t)=a t+k
$$

At a certain manufacturing plant, the total number of vacation days, $V(t)$, an employee has accrued is given by the function above, where $t$ is the number of years the employee has worked at the plant, and $a$ and $k$ are constants. If Martin has accrued 9 more vacation days than Emilio has, how many more years has Martin worked than Emilio?
A) $\frac{9}{a}$
B) $9-a$
C) $9+a$
D) $9 a$

In the figure above, $\sin x^{\circ}=\frac{2 \sqrt{29}}{29}$. What is the
perimeter of the figure?
A) $10+\frac{2 \sqrt{29}}{29}$
B) $7+\sqrt{29}$
C) $14+2 \sqrt{29}$
D) $39+2 \sqrt{29}$

At Santa Monica High School, the ratio of juniors to seniors is 4 to 3 , the ratio of seniors to sophomores is 5 to 4 , and the ratio of freshmen to sophomores is 7 to 6 . What is the ratio of freshmen to seniors?
A) $\frac{7}{3}$
B) $\frac{5}{3}$
C) $\frac{9}{7}$
D) $\frac{14}{15}$

31
Hayoung is competing in a triathlon comprised of swimming, running, and biking. She starts by swimming $m$ miles. Next, she runs 11 times the distance that she swims. Finally, she bikes 18 times the distance that she swims. If Hayoung swims 2.5 miles, what is the total distance, in miles, Hayoung travels as she competes?

32
At the local mall, Casey's Card Cart sells cards à la carte. Casey's revenue $R$, in dollars, for $x$ days is given by the function $R(x)=250 x-20$. If Casey earned $\$ 1,230$, how many days has she sold cards?

Marty is planning which crops to plant on his farm for the upcoming season. He has enough seed to plant 4 acres of wheat and 7 acres of soybeans, but the total area of farmland he owns is only 9 acres. He earns $\$ 90$ per acre for every acre of wheat planted and $\$ 120$ for every acre of soybeans planted, and he must pay a $10 \%$ tax on all money he earns from selling his crops. What is the maximum profit, in dollars, that Marty can earn from planting wheat and soybeans this season?

What is the area of the shaded region of the circle, bound by the $x$-axis and the line $y=-x$, rounded to the nearest whole number?

35

In the figure, $\overline{A C}$ is bisected by $\overline{B D}$. If $\overline{B C}$ is 7 , then what is the length of $\overline{B D}$ ?

36
The daily recommended serving of protein is 50 grams. A nutritional bar contains $32 \%$ of the daily recommended serving of protein and $10 \%$ of the daily recommended serving of fat. If the nutritional bar contains $700 \%$ more grams of protein than grams of fat, what is the daily recommended serving of fat, in grams? (Disregard units when gridding your answer.)

## Questions 37 and 38 refer to the following information.

Set $R$ consists of all the one-digit prime numbers. Set $S$ contains all of the elements of Set $R$, as well as an additional positive integer, $x$.

37
If the sum of all of the elements of $\operatorname{Set} S$ is 30 , what is the value of $x^{2}-11 x-25$ ?

Michael wants to change the value of $x$ so that the mean of Set $S$ is equal to the median of Set $S$ and for Set $S$ to have no mode. What value of $x$ would accomplish his goal?

If you finish before time is called, you may check your work on this section only. Do not turn to any other section in the test.

## Section 3: Math (No Calculator)

1. B Because Marco already has 75 pounds of salt, he needs $200-75=125$ additional pounds. Estimate the number of bags he needs. 125 is close to 120 , and $120 \div 30=4$, so he must need more than 4 bags (because 125 is more than 120). This means that Marco needs at least 5 more bags. Therefore, the correct answer is (B).
2. C Whenever there are variables in the question and in the answers, think Plugging In. Let $d=2$. The number of subscribers the website has signed up so far can be calculated as $500(2)=1,000$. Therefore, the website needs to sign up $100,000-1,000=99,000$ additional subscribers. Plug 2 in for $w$ in the answers to see which answer equals the target number of 99,000. Choice (A) becomes $W=500(2)=1,000$. This doesn't match the target number, so eliminate (A). Choice (B) becomes $W=99,500(2)=199,000$. Eliminate (B). Choice (C) becomes $W=100,000-500(2)=100,000-1,000=99,000$. Keep (C), but check (D) just in case it also works. Choice (D) becomes $W=100,000$ $+500(2)=100,000+1,000=101,000$. Eliminate (D). The correct answer is (C).
3. C Since the question states $f(4)=5$, then when $x=4$, the result should be 5 . Plug in $x=4$ into each answer choice to see which equation does NOT equal 5 . Choice (A) becomes $f(4)=4+1=5$. This works, so eliminate (A). Choice (B) becomes $f(4)=2(4)-3=8-3=5$. Eliminate (B). Choice (C) becomes $f(4)=$ $3(4)-2=12-2=10$. The correct answer is (C).
4. D Factor the expression to get $\frac{x^{2}(x+1)}{x^{3}(x+1)}$. Reduce the fraction to get $\frac{x^{2}}{x^{3}}$, or $\frac{1}{x}$. Another way of writing $\frac{1}{x}$ is $x^{-1}$. Therefore, the correct answer is (D).
5. A Start with the easier equation first and use Process of Elimination. The easier
equation has to do with the total number of solutions. According to the question, Régine measures a total of 100 solutions. This information can be expressed as $x+y=100$. Eliminate (B) and (C) because neither of these answers includes this equation. Remember that percentage means divided by 100 . Therefore, $40 \%=0.4$ and $70 \%=0.7$. Given this information, $x$ should be associated with 0.4 and $y$ should be associated with 0.7 . On this basis eliminate (D). The correct answer is (A).
6. B The graph shown is a regular parabola that has been turned upside down and moved down 6. The equation of a regular parabola that points upward is $y=x^{2}$. Therefore, the graph of a parabola that points downwards is $y=-x^{2}$. Eliminate (D) because that answer is missing the negative sign. To move a parabola down 6 units, a 6 must be subtracted from the equation of the parabola. Eliminate (A) and (C), which add 6 instead. Choice (B) can be rewritten as $y=$ $-x^{2}-6$. The correct answer is (B).
7. A Use Process of Elimination to solve this question. According to (A), the price of the item in 1999 was $\$ 10$. According to the question, the price of the item in 2010 was $\$ 43$, and the price of the item increased by $\$ 3$ every year. 1999 is 11 years before 2010. Therefore, the price of the item in 1999 can be calculated as $43-11(3)=10$. Keep (A) but check the other answer choices just in case. Eliminate (B) and (C), since these answers could not also be correct. Eliminate (D) because the annual price increase is given as $\$ 3$ in the question. Therefore, the correct answer is (A).
8. C Use the formula arc $=r \theta$, where $r$ is the radius and $\theta$ is the measure of the central angle in radians. Because the angle is already in radians, you just need to plug in 10 for the radius and the angle $\frac{2 \pi}{5}$ into the formula. You then get $s=$ (10) $\frac{2 \pi}{5}$ or $4 \pi$, which is (C).
9. B Start by calculating the least amount of acetaminophen the child needs. If the child is 75 pounds, then the amount of acetaminophen needed can be calculated as $\frac{75}{150} \times 1,000=\frac{1}{2} \times 1,000=500$. Since, only $(B)$ gives 500 as the low-end value, the correct answer is (B).
10. C Whenever there are variables in the question and in the answer choices, think Plugging In, picking numbers that ensure that $I$ is an integer. If $P=18$ and $R=$ 2, then $I=\sqrt{\frac{P}{R}}=\sqrt{\frac{18}{2}}=\sqrt{9}=3$. Because $V=I R, V=3 \times 2=6$. Plug $P=18, R=$ 2, and $V=6$ into the answers to see which answer works. Choice (A) becomes $18=\frac{2}{6^{2}}$. Solve the right side of the equation to get $18=\frac{2}{36}$. This statement is not true, so eliminate (A). Choice (B) becomes $18=\frac{6}{2}$. This statement is not true, so eliminate (B). Choice (C) becomes $18=\frac{6^{2}}{2}$. Solve the left side of the equation to get $18=\frac{36}{2}$. This statement is true, so keep (C), but check the remaining answer just in case. Choice (D) becomes $18=\left(6^{2}\right)\left(2^{3}\right)$ or $18=36 \times$ 8. This statement is not true, so eliminate (D). The correct answer is (C).
11. D A root of the equation is the same as an $x$-intercept. In the graph, the function crosses the $x$-axis at 4 points. Therefore, the correct answer is (D).
12. A Label the congruent angles, $\angle A B C$ and $\angle C D E$, as such. In order to find the measure of those angles, use the formula $180(n-2)$, where $n$ is the number of sides, to determine the sum of the interior angles of the figure. Because the figure has five sides, plug 5 in for $n$ to get $180(5-2)$, or $180(3)$, which equals 540 . Subtract 120 to get 420 . Subtract 100 to get 320 . Subtract 40 to get 280 . Since the two remaining angles are congruent, divide by 2 to find that the two unlabeled angles are both equal to 140 . Because $\angle A B C$ and $\angle B C D$ have a combined measure of $180, \overline{A B}$ and $\overline{C D}$ are parallel. Therefore, (A) accurately describes the relationships in the figure.
13. B Taking the 4 th root of a number is the same as taking the number to the $\frac{1}{4}$ power. Therefore, the equation can be rewritten as $2 w^{\frac{3}{4}} x^{\frac{9}{4 w}}=2\left(3^{\frac{3}{4}}\right)\left(x^{\frac{3}{4}}\right)^{4}$. Divide both sides by 2 to get $w^{\frac{3}{4}} x^{\frac{9}{4 \omega}}=\left(3^{\frac{3}{4}}\right)\left(x^{\frac{3}{4}}\right)$. Therefore, in the equation $w^{\frac{3}{4}}=3^{\frac{3}{4}}$ and $x^{\frac{9}{4 w}}=x^{\frac{3}{4}}$, so $w=3$. The correct answer is (B).
14. C Whenever there are variables in the question and in the answers, think Plugging In. If $a=2$ and $b=3, r=\left[\frac{1}{2}(2)+3\right]^{2}=(1+3)^{2}=16$, and $s=-4(2)(3)$ $+3(3)=-24+9=-15$. The expression $r-2 s$ becomes $16-2(-15)=16+30$ $=46$. Plug 2 in for $a$ and 3 in for $b$ in each of the answers to see which answer equals the target number of 46 . Choice (A) becomes $\frac{1}{4}\left(2^{2}\right)+3^{2}-7(2)(3)-$ $6(3)=1+9-42-18=-50$. This does not match the target number, so eliminate (A). Choice (B) becomes $\frac{1}{4}\left(2^{2}\right)+3^{2}-7(2)(3)+6(3)=1+9-42+$ $18=-14$. Eliminate (B). Choice (C) becomes $\frac{1}{4}\left(2^{2}\right)+3^{2}+9(2)(3)-6(3)=1+$ $9+54-18=46$. Keep (C), but check (D) just in case it also works. Choice (D) is the same as (C) except for the coefficient on the $a^{2}$ term, so it can't equal 46 . Eliminate (D). The correct answer is (C).
15. C First, start with a sketch of the two points to see what the line in question might look like.

The point directly between the two points will definitely be on the line, so find the midpoint of the two points. Midpoint $=\left(\frac{x_{1}+x_{2}}{2}, \frac{y_{1}+y_{2}}{2}\right)=\left(\frac{0+8}{2}, \frac{4+0}{2}\right)$ $=(4,2)$. Check this point in the answer choices and eliminate any that do not contain it. Choice (A) becomes $2(2)=-4+8$ or $4=4$, which is true. Choice (B) becomes $2(2)=4$, and (C) becomes $2=2(4)-6$ or $2=8-6$. These are also true, but (D) becomes $2=-2(4)$, which is false. Eliminate (D). To sketch the remaining equations, rewrite them in slope-intercept form of the equation $y=$
$m x+b$, where $m$ is the slope and $b$ is the $y$-intercept. Choice (A) becomes $y=$ $-\frac{1}{2} x+4$, (B) becomes $y=\frac{1}{2} x$, and (C) is already in the right form. Now sketch the graphs of each of these on the $x y$-plane.

The line in (A) contains both the given points, but all the points to the left of $(0,4)$ are closer to that point and all those to the right of $(8,0)$ are closer to it. So eliminate (A). Many points on line (B) are also clearly closer to one or the other of the given points, so eliminate (B). Line (C) appears to be perpendicular to the line formed by the two given points, and this is in fact what will make all the points on a line equidistant from 2 given points.

Therefore, the correct answer is (C).
16. $\frac{7}{3}$ or
2.33

Get rid of the fractions in the first equation by multiplying the entire equation by 6 , to get $2 p+3 q=6$. Whenever there are two equations with the same two variables, they can be solved simultaneously by adding or subtracting them. The key is to get one variable to disappear. Stack the equations and add them.

$$
\begin{array}{r}
2 p+3 q=6 \\
p-3 q=1 \\
3 p \quad=7
\end{array}
$$

Therefore, $p=\frac{7}{3}$.
17. 6 Substitute $x$ for $y$ in the second equation to get $(x-2)^{2}-4=-x$. Expand the left side of the equation to get $(x-2)(x-2)-4=-x$ or $x^{2}-4 x+4-4=-x$. Simplify the equation to get $x^{2}-4 x=-x$. Set the equation to 0 to get $x^{2}-3 x=$ o. Factor an $x$ out of the equation to get $x(x-3)=0$. Therefore, either $x=0$ or $x-3=0$, and $x=3$. According to the question, the point of intersection is in quadrant I , where the $x$ and $y$ values are both positive. Therefore, $x=3$ and $y=$ 3 . The sum of $3+3=6$. The correct answer is 6 .
18. 6 Try Plugging In different values of $c$ to see which ones work. Make a table to keep track of all the numbers.

| $c=$ | $(c-1)^{2}=$ |
| :---: | :---: |
| 1 | $(1-1)^{2}=0$ |
| 2 | $(2-1)^{2}=1$ |
| 3 | $(3-1)^{2}=4$ |
| 4 | $(4-1)^{2}=9$ |
| 5 | $(5-1)^{2}=16$ |

| 6 | $(6-1)^{2}=25$ |
| :--- | :--- |
| 7 | $(7-1)^{2}=36$ |

The largest value of $c$ that works without hitting the boundaries of the inequality is 6 , so the correct answer is 6 .
19. $\mathbf{8}$ When no picture is provided, it helps to draw one. First, rewrite each equation so that it is in the slope-intercept form of a line, which is $y=m x+b$, where $m$ is the slope and $b$ is the $y$-intercept of the line. The first equation becomes $2 y$ $\leq x+4$, or $y \leq \frac{1}{2} x+2$. The second equation becomes $y \geq 2 x-4$. The resulting graph looks as follows:

As the graph shows, the greatest $x+y$ is the point at which the two lines
intersect. Set the equations of the two lines, $y=\frac{1}{2} x+2$ and $y=2 x-4$, equal to each other and solve for $x$. The resulting equation is $\frac{1}{2} x+2=2 x-4$. Solve for $x$ to get $-\frac{3}{2} x+2=-4$ or $-\frac{3}{2} x=-6$, so $x=4$. Next, plug 4 into one of the two equations to solve for $y$. Therefore, $y=2(4)-4=4$ and $x+y=4+4=8$. The correct answer is 8 .
20. $\frac{80}{3}$
or $\mathbf{2 6 . 6}$ or

## 26.7

Start by drawing the figure and labeling what you know. Because you know $A B C D$ and $W X Y Z$ are both squares, you know all the sides:

To find the areas of the two pyramids, you need the area of the bases and the heights. Because $Q$ is equidistant from the points in each square and all the lines between the squares go through point $Q, Q$ must itself be equidistant from the two planes. That makes $Q 2.5$ units from the middle of square $A B C D$
and also 2.5 units from the middle of square $W X Y Z$. This distance is the height of each pyramid.

Because the pyramids are equal, you can solve for the volume of one pyramid and double that for the answer.

## Section 4: Math (Calculator)

1. D Whenever there are variables in the question and in the answers, think Plugging In. Let $d=2$. For $\$ 1$ the air pump dispenses $90 \times 4=360$ pounds of air. Therefore, for $\$ 2$ the air pump will dispense $360 \times 2=720$ pounds of air. Plug in 2 for $d$ in the answer choices to see which answer equals 720 . Choice (A) becomes $P=2+90=92$. Eliminate (A). Choice (B) becomes $P=2+360=$ 362. Eliminate (B). Choice (C) becomes $P=90(2)=180$. Eliminate (C). Choice (D) becomes $P=360(2)=720$. Therefore, the correct answer is (D).
2. A Set up a proportion: $\frac{1 \text { foot }}{0.30 \text { meters }}=\frac{6 \text { feet }}{x \text { meters }}$. Cross-multiply to get $x=6 \times 0.30$ $=1.8$ meters. Therefore, the correct answer is (A).
3. B In order to find the undeveloped area, take the entire area of the park and subtract the area of the developed portions. Subtract the 4 acre lake to get 44 $4=40$ undeveloped acres. Next, subtract the largest and smallest possible soccer field area: $40-10=30$, and $40-8=32$. Therefore, the correct answer is ( B ).
4. B Weight is shown on the horizontal axis of the graph, given in tons. Look for the mark indicating 3 on this axis; then draw a vertical line from that mark to the line of best fit. Once you hit it, draw a horizontal line over to the vertical axis. It should hit between 20 and 25 miles per gallon, slightly closer to the mark for 25 . This makes (B) the credited response. Draw your lines carefully, using your answer sheet as a straightedge if necessary, to avoid trap answers like the close-but-not-quite (C).
5. C You can see from the graph that from 2000 to 2002 , the number of coati increased from 140 to 160 . From 2002 to 2004, the number increased from 160 to 180 . Therefore, the number of coati is increasing at a rate of 20 every 2 years. In 2006, if the rate of increase remains the same, the number of coati
should be $180+20=200$, which is $(C)$.
6. B The question states that there are infinitely many solutions to the equation. That means any real number should work for $d$. Plug in an easy number like o for every $d$ in the equation to get $\frac{0+10-0}{3}=\frac{0+a}{3}$. Simplify the equation to $\frac{10}{3}=\frac{a}{3}$, so $a=10$, which is (B).
7. A First, convert the minutes shown in the graph to seconds. Multiply 15 minutes by 60 seconds to get 900 seconds. Then, since speed is distance divided by time, simply divide 3,000 meters by 900 seconds. The answer is $3.3 \mathrm{~m} / \mathrm{s}$, which is (A).
8. Clug 2 in for $y$ in the answers to see which function most closely equals the area of 14,910 . Choice (A) becomes $15,000\left(\frac{1}{2}\right)=7,500$. This does not match the target number, so eliminate (A). Choice (B) becomes $15,000(0.003)^{2}=$ 0.135. Eliminate (B). Choice (C) becomes $15,000(0.997)^{2} \approx 14,910$. The correct answer is (C).
9. B First, calculate what Mike's daily calorie consumption is during finals. $12 \%$ of 1,680 is $0.12 \times 1,680=201.6$. During finals Mike consumes $1,680+201.6=$ $1,881.6$ calories per day. Whenever the question includes variables, Plug in. Let $d=2$. Over 2 days Mike consumes $2 \times 1,881.6=3,763.2$ calories. He also adds 900 calories at the end of finals. His total consumption over the entire finals period is $3,763.2+900=4,663.2$ calories, so $4,663.2$ is the target number. Plug in 2 for $d$ in each of the answer choices. In (A), 1.12 $[1,680(2)+900]=4,771.2$, which is not the target number. Eliminate (A). In (B), $1.12[1,680(2)]+900=$ 4,663.2, which is the target. Leave (B), but check the other answer choices just in case. $\operatorname{In}(C), 1.12(1,680+900)(2)=5,779.2$, and in (D), $[1,680+(0.12)(2)]+$ $900=2,580.24$. Eliminate both (C) and (D). The correct answer is (B).
10. D Use Process of Elimination on this question. Choice (A) cannot be correct because more juniors prefer Austin to Pensacola. Choice (B) sounds appealing, but "more than three times as likely" means the seniors as a whole need to
prefer Pensacola more than three times as much as the juniors do as a whole. Seniors prefer Pensacola 23 out of 42 , or $55 \%$. Juniors prefer it 7 out of 21 , or $33 \%$. So, seniors do not prefer Pensacola more than three times as much as juniors do. You can also eliminate (C) because more than half of all juniors prefer Austin, while less than half of all seniors prefer Austin. The statement in (D) is correct since 7 is one-third of the total of 21 juniors.
11. B We are looking for the probability that a randomly selected person is a man with a doctoral degree. There are 16,232 men with doctoral degrees, and 220,532 total adults aged 25 years or older. So the probability that a randomly selected person fits the category we are looking for is $\frac{16,232}{220,532}=0.07=7 \%$, which is (B).
12. C Whenever there are variables in the question and in the answers, think Plugging In. If $x=10$, then $C=110+\frac{10}{2}=110+5=115$ and $R=15(10)-\frac{10^{2}}{10}$ $=150-\frac{100}{10}=150-10=140$. Therefore, the profit can be calculated as $140-$ $115=25$. Plug 10 in for $x$ in the answers to see which answer equals the target number of 25 . Choice (A) becomes $-\frac{10^{2}}{10}-\frac{31}{2}(10)+110=-\frac{100}{10}-31(5)+$ $110=-10-155+110=-55$. This doesn't match the target number, so eliminate (A). Choice (B) becomes $-\frac{10^{2}}{10}-\frac{29}{2}(10)+110=-\frac{100}{10}-29(5)+110$ $=-10-145+110=-45$. Eliminate (B). Choice (C) becomes $-\frac{10^{2}}{10}+\frac{29}{2}(10)-$ $110=-\frac{100}{10}+29(5)-110=-10+145-110=25$. Keep (C), but check (D) just in case it also works. Choice (D) becomes $-\frac{10^{2}}{10}+\frac{31}{2}(10)-110=-\frac{100}{10}+31(5)$ $-110=-10+155-110=35$. Eliminate (D) and choose (C).
13. D To stay at his fancy hotel for three nights at 2,000 Moroccan dirhams per night, Erik will need 6,000 dirhams. Using the currency conversion rate of 1 dirham $=\$ 0.11$, we can multiply $6,000 \times 0.11$ to determine that Erik's hotel
stay will cost $\$ 660$. Since his bank allows him to withdraw only $\$ 200$ at a time, Erik must go to the ATM four times: (D).
14. C Start with the easier equation first and use Process of Elimination. The easier equation involves the total amount of gas sold. According to the question, 850 gallons of gasoline were sold, which can be expressed as $u+p=850$. Eliminate (D) since it does not include this equation. The other equation in the answers is related to the amount of money collected. According to the question, \$3,016.50 was collected; however, this sum included a discount of $\$ 0.10$ per gallon for 100 of the gallons that were purchased or $\$ 0.10 \times 100=$ $\$ 10$. Without the discount unleaded gas costs $\$ 3.49$ and premium gas costs $\$ 3.79$ a gallon, and the amount of money collected would have been \$3,016.50 $+\$ 10=\$ 3,026.50$. Only $(\mathrm{C})$ provides the correct total. Therefore, the correct answer is (C).
15. B First, let's figure out how many students are enrolled in AP courses other than Biology and U.S. History. We know that 319 students are enrolled in at least one AP course, and of those, $75+58=133$ are enrolled in Biology and U.S. History. However, since 22 students are enrolled in both of those courses, we need to subtract 22 from 133 (so as not to double-count the students taking both courses). That leaves us with $133-22=111$ total students who are taking AP Biology and AP U.S. History. Of the 319 students taking AP courses, that means there are $319-111=208$ students taking AP courses other than Biology and U.S. History. We know that there are 784 juniors and seniors total, so $\frac{208}{784}=0.265$, or approximately $27 \%$ of all juniors and seniors, which is (B).
16. A Total score $=$ average score $\times$ the number of tests. In order for Mateo to receive a $B$, he needs his total score over the 3 tests to be between $3 \times 80=$ 240 points and $3 \times 89=267$ points. On his first and second tests, Mateo scored a total of $79+95=174$ points. Therefore, on his third test Mateo must score between $240-174=66$ and $267-174=93$ points in order to receive a B. The correct answer is (A).
17. A Use Process of Elimination to solve this question. Choice (A) is possible so leave it. Choice (B) discusses the mass of the fertilizer, but no reference to mass is made in the question. Eliminate (B). According to the question, the quantity described in (C) is represented by $A$, so eliminate (C). According to the question, the quantity described in (D) is represented by $Y$, so eliminate (D). The correct answer is (A).
18. D The mode of the combined groups cannot be determined without knowing exactly what scores each group received. To illustrate this, plug in! Let's say that the scores of Group A were $\{1,1,7,7,7\}$, and the scores for Group B were $\{1,1,6,6,6\}$. The scores of the whole group would, therefore, be $\{1,1,1,1,6,6$, $6,7,7,7\}$. This set has a mode of 1 , so eliminate (A), (B), and (C) and choose (D).
19. Cirst, count the number of blocks that Josh needs to drive. He needs to drive 4 blocks north and 6 blocks east for a total of 10 blocks. You need to convert this into miles, which can be done with the following proportion: $\frac{10 \text { blocks }}{x \text { miles }}=\frac{1 \text { block }}{.6 \text { miles }}$. The drive is a total of 6 miles. Since Josh drives at 30 miles per hour, you can set up a second proportion: $\frac{30 \text { miles }}{1 \text { hour }}=\frac{6 \text { miles }}{x \text { hours }}$. Crossmultiply and solve to get that $x=\frac{6}{30}$ or $\frac{1}{5}$ of an hour. This equals 12 minutes in (C).
20. D The first step is to rewrite the bottom equation so that it is in the same format as the first equation. Move all of the variables in the bottom equation to the left side of the equation to get $6 s-t=12$. If the answer is (A) and there are infinitely many solutions to the system of equations, then the two equations must be the same equation. To determine whether this is the case, multiply the top equation through by 3 to get $6 s-t=30$. Since it cannot be the case that the equation $6 s-t$ equals both 12 and 30 , the correct answer is (D). There are no solutions to the system of equations.
21. C Two factors are important in determining how to poll a group: the size of the sample and how that sample is selected. Secretary Stephens's plan has the largest sample with 250 students, but all those students belong to the senior
class. Perhaps the senior class would prefer a theme that the other three classes would not. The sample is skewed and not necessarily representative of the entire student body, so eliminate (B). The other three plans all poll 100 students, so the manner in which those students are selected becomes more important. President Peterson's plan is also skewed specifically to friends of the student council members, whose opinions might not reflect the majority, so eliminate (A). Vice President Vaiyda's plan has more potential for a varied sample, but it is still not as good as Treasurer Thompson's plan, which guarantees that a random assortment of people will be chosen for the poll. Eliminate (D), and choose (C).
22. C Since $x$ and $y$ are points on the circle, plug in the point $(-2,-2)$ into the left side of the equation. This gives you $(-2+3)^{2}+(-2-1)^{2}$, which equals $1^{2}+$ $(-3)^{2}$. Simplifying, you get 10 . Because 10 is greater than $r^{2}$ (which is 9 ), the point must be outside the circle, which is (C).
23. D Whenever the question includes variables, think Plugging In. According to the question, $\frac{x-12}{\sqrt{8}}=\frac{x \sqrt{2}}{4}-C$. Plug in 12 for $x$ to get $\frac{12-12}{\sqrt{8}}=\frac{12 \sqrt{2}}{4}-C$, or $\frac{0}{\sqrt{8}}=\frac{12 \sqrt{2}}{4}-C$. Solve for $C$ to get $0=\frac{12 \sqrt{2}}{4}-C$, then $\mathrm{o}=3 \sqrt{2}-C$, and finally $3 \sqrt{2}=C$. The correct answer is (D).
24. A All of the answer choices refer to the number of salary-satisfied bachelor's-degree-holders, so you must use the follow-up survey results to calculate that number. First, find the percent of bachelor's-degree-holders who reported also being salary-satisfied in the follow-up survey. This number was 658 out of the 1,000 people, so divide 658 by 1,000 and then multiply by 100 to get the percent. The result is $65.8 \%$ salary-satisfied bachelor's-degree-holders for the follow-up survey. Since the people in the follow-up were randomly selected, you can assume that they are generally representative of the bachelor's-degree-holding population at large. Therefore, the $65.8 \%$ of salary-satisfied individuals should be true of all $24,236,000$ job-satisfied bachelor's-degreeholders. Watch the units on charts-this one is in the thousands, so there are $24,236,000$ not 24,236 job-satisfied bachelor's-degree-holders. Multiply $65.8 \%$, or .658 , by the total number of bachelor's-degree-holders, $24,236,000$, to find that there should be $15,947,288$ salary-satisfied, job-satisfied
bachelor's-degree-holders. Choice (A) is the closest to this and is the credited response.
25. A The equation of a line expressed in slope-intercept form is $y=m x+b$, where $m$ is the slope and $b$ is the $y$-intercept. One way to find the $y$-intercept of line $d$ is to plug in the slope and given point and slope for $b$. The equation $y=m x+b$ becomes $1=\frac{4}{5}(1)+b$. Subtract $\frac{4}{5}$ from both sides to get $b=\frac{1}{5}$. Another approach is to use the slope formula to find $b$. The $y$-intercept of a line is where the line crosses the $y$-axis; at that point $x=0$. Therefore, in addition to the point $(1,1)$, there is another point $(0, b)$ that lies on line $d$. The equation for finding the slope of the line given two points is $\frac{y_{2}-y_{1}}{x_{2}-x_{1}}$. Therefore $\frac{b-1}{0-1}=\frac{4}{5}$ or $\frac{b-1}{-1}=\frac{4}{5}$. Cross-multiply to get $5(b-1)=-4$. Distribute the 5 to get $5 b-5$ $=-4$. Solve for $b$ to get $5 b=1$, and $b=\frac{1}{5}$. The $y$-intercept of line $e$ is 3 times $\frac{1}{5}$, so the $y$-intercept of line $e$ is $\frac{3}{5}$. Additionally, parallel lines have slopes that are equal to each other. Therefore, line $e$ will also have a slope equal to $\frac{4}{5}$. Rewrite the equation in (A) in the slope-intercept form of the equation to get $5 y=4 x$ +3 , or $y=\frac{4}{5} x+\frac{3}{5}$. The slope of this line is $\frac{4}{5}$ and the $y$ intercept is $\frac{3}{5}$. Therefore, the correct answer is (A).
26. B An extraneous solution is an answer that when plugged back into the equation causes the equation to be false. Begin by factoring and reducing the fraction on the left side of the equation to get $\frac{(q-7)(q+6)}{q+6}=\sqrt{q-5}$ or $q-7=\sqrt{q-5}$.
Square both sides of the equation to get $q^{2}-14 q+49=q-5$. Set the equation to o to get $q^{2}-15 q+54=0$. Factor the quadratic to get $(q-9)(q-6)=0$. Therefore, $q=9$ or $q=6$. Eliminate (A) and (C) because neither of these
answers is a possible solution for $q$. Plug 6 in for $q$ in the equation to see if this value of $q$ works. The equation becomes $\frac{6^{2}-6-42}{6+6}=\sqrt{6-5}$. Solve both sides of the equation to get $\frac{-12}{12}=1$. Since this statement is not true, 6 is the extraneous solution. The correct answer is (B).
27. D First, determine the total number of gamers in each game type by adding up the columns. There are $110,000,000$ gamers preferring first person shooters, $52,000,000$ preferring sports games, and $85,000,000$ preferring adventure games. You don't know by how much the 9 - to 13 -year old group will increase in sport game preference, but presumably the increase will be made to match the currently largest group, first person shooters. Therefore, in order to raise adventure games to the level of first person shooters, you need to add $110,000,000-85,000,000=25,000,000$ gamers to the adventure games group. If you are going to do so by doubling one of the age groups, then $25,000,000$ is equal to the size of the current group. 9 - to 13 -year olds currently have $25,000,000$ preferring adventure games, so (D) is your answer.
28. A Whenever there are variables in the question and in the answers, think Plugging In. Let's say that for Emilio $a=2, t=4$, and $k=10$. Then Emilio's accrued vacation days can be calculated as $V(t)=2(4)+10=18$. This means that Martin has accrued $18+9=27$ vacation days. Because $a$ and $k$ are constants, their values do not change. The number of years that Martin has worked at the manufacturing plant can therefore be calculated as $27=2 t+10$. Solve for $t$ to get $17=2 t$ or $t=\frac{17}{2}=8.5$. Therefore, Martin has worked $8.5-4$ $=4.5$ more years than Emilio. Plug 2 in for $a$ in the answers to see which answer equals 4.5. Choice (A) becomes $\frac{9}{2}=4.5$. Keep (A) but check the remaining answers just in case. Choice (B) becomes $9-2=7$, (C) becomes $9+$ $2=11$, and $(D)$ becomes $9(2)=19$. Eliminate $(B),(C)$, and (D). The correct answer is (A).
29. C SOHCAHTOA tells you that sine is $\frac{\text { opposite }}{\text { hypotenuse }}$, so if the side opposite the angle with measure $x^{\circ}$ is $O$ and the hypotenuse is $H$, then $\frac{O}{H}=\frac{2 \sqrt{29}}{29}$. Solve for $O$, and you get $\frac{2 H \sqrt{29}}{29}$. Now, you can use the Pythagorean theorem with the given side and substituting $\frac{2 H \sqrt{29}}{29}$ for $O$ in order to solve for $H: 10^{2}+$ $\left(\frac{2 H \sqrt{29}}{29}\right)^{2}=H^{2}$. Solve the exponents, and then reduce the fraction: $100+$ $\frac{116 H^{2}}{841}=H^{2} ; 100+\frac{4 H^{2}}{29}=H^{2}$. Subtract $\frac{4 H^{2}}{29}$ from both sides: $100=\frac{25 H^{2}}{29}$. Divide both sides by $\frac{25}{29}$, so $116=H^{2}$. Square root both sides, and you find that $H=2 \sqrt{29}$. Using $O=\frac{2 H \sqrt{29}}{29}$ from above, you can solve for $O$ : $O=\frac{2(2 \sqrt{29}) \sqrt{29}}{29}=4$. Add the sides and you get $14+2 \sqrt{29}$, which is (C).
30. D A good approach to this question would be to plug in some numbers. Start with the number of juniors and plug in a number that is easy to deal with, such as 200 . Then you can set up a proportion using the ratio given in the question stem: $\frac{\text { juniors }}{\text { seniors }}=\frac{4}{3}=\frac{200}{x}$. Cross-multiply and solve for $x$ to determine that the number of seniors would be 150 . Next, use the relationship $\frac{\text { seniors }}{\text { sophomores }}=\frac{5}{4}$. Using 150 for seniors, you get $\frac{\text { seniors }}{\text { sophomores }}=\frac{5}{4}=\frac{150}{x}$. Crossmultiply and solve for $x$ to determine that the number of sophomores would be 120. Next, use the relationship $\frac{\text { freshmen }}{\text { sophomores }}=\frac{7}{6}$. Using 120 for sophomores, you get $\frac{\text { freshmen }}{\text { sophomores }}=\frac{7}{6}=\frac{x}{120}$. Cross-multiply and solve for $x$ to determine that the number of freshmen would be 140 . The ratio of freshmen to seniors, therefore, would be $\frac{\text { freshmen }}{\text { seniors }}=\frac{140}{150}=\frac{14}{15}$, which is (D).
31. 75 Hayoung swims 2.5 miles. She runs $11 \times 2.5=27.5$ miles, and she bikes $18 \times$ $2.5=45$ miles. Her total triathlon mileage $=2.5+27.5+45=75$ miles. The correct answer is 75 .
32. 5 Plug 1,230 in for the value of the function to get $1,230=250 x-20$. Solve for $x$ to get $1,250=250 x$ and $x=5$. The correct answer is 5 .
33. $\mathbf{9 1 8}$ In order to find the greatest profit, maximize the number of acres of soybeans Marty plants, since soybeans bring in more money per acre than does wheat. At most, Marty can plant 7 acres of soybeans. Therefore, the most money he can make on soybeans is $7 \times 120=840$. He then has $9-7=2$ acres left on which to plant wheat. The money he makes from this wheat is $2 \times 90=180$. The total amount Marty makes before taxes is therefore $840+180=1,020$. The tax on this money equals $1,020 \times 0.10=102$. Subtract the amount Marty pays in taxes to get $1,020-102=918$ profit. The correct answer is 918 .
34. 19 The formula for the area of a circle is $A=\pi r^{2}$. If a full circle were shown, its radius would be 4 , so the area of the full circle would be $A=\pi 4^{2}=16 \pi$. The interior angle of the fraction of the circle shown can be calculated as $90+45=$ 135 degrees. Therefore, the figure shown is $\frac{135}{360}$ of the area of a full circle. The area of the figure can be calculated as $\frac{135}{360}(16 \pi)=0.375(16 \pi)=6 \pi \approx 18.8 \approx 19$. The correct answer is 19 .
35. 6 The two triangles share three angles; thus they are similar. $\overline{A C}$ is twice the length of $\overline{B C}$. because it is bisected by $\overline{B D}$. This relationship is constant between the two similar triangles. Therefore, $\overline{B D}$ is half of $\overline{A E}: 12 \div 2=6$.
36. $2 \boldsymbol{0}$ First, determine the grams of protein in the bar. If the bar contains $32 \%$ of the daily recommended serving of protein, and the daily recommended serving of protein is 50 grams, then the bar contains $0.32 \times 50=16$ grams of protein. Next, determine the grams of fat in the bar by using the percent change equation: percent change $=\frac{\text { difference }}{\text { original }} \times 100$. The percent change is 700 , and
the original is the grams of fat (because percent more means the original is the smaller number), which means $700=\frac{16-x}{x} \times 100$. Divide both sides by $100: 7$ $=\frac{16-x}{x}$. Multiply both sides by $x$ to get $7 x=16-x$. Add $x$ to both sides to get $8 x=16$. Divide both sides by 8 and you find $x=2$. That is the number of grams of fat in the bar. To find the daily recommended serving of fat, translate English to math. 2 is $10 \%$ of the daily recommended serving, so if the daily recommended serving is $y, 2=0.10 y$. Divide both sides by 0.10 , and you find that the daily recommended serving of fat is 20 .
37. 1 First, you need to determine the content of Set $R$. If Set $R$ consists of all the one-digit prime numbers, then $R=\{2,3,5,7\}$. The sum of the elements of Set $S$ would therefore be $2+3+5+7+x=30$. Combine like terms: $17+x=30$. Subtract 17 from both sides, and you find $x=13$. Plug $x=13$ into the equation and solve: $(13)^{2}-11(13)-25=1$.
38. $\mathbf{8}$ The additional positive integer $x$ cannot equal $2,3,5$, or 7 (otherwise there would be a mode). Next, determine what the median could be for various ranges of $x$. If $x$ is less than 2 , then the set would be, in consecutive order, $\{x$, $2,3,5,7\}$, making the median 3 . Try this set. If the median equals the mean, then the sum of the elements divided by 5 (the number of elements) must equal $3: \frac{x+2+3+5+7}{5}=3$. Multiply both sides by 5 and combine like terms: $x+17=15$. Subtract 17 from both sides, and you find $x=-2$. However, $x$ must be a positive integer, so this doesn't work. Try a new median. If $x=4$, then the set is $\{2,3,4(x), 5,7)$, with a median of 4 . However, the mean is $\frac{2+3+4+5+7}{5}=5.25$, not 4 , so this doesn't work. If $x$ is 6 or greater, the set would either be $\{2,3,5,6(x), 7\}$ or $\{2,3,5,7, x\}$. In either case, the median is 5. Set up the average equal to the median of $5: \frac{2+3+5+7+x}{5}=5$. Multiply
both sides by 5 and combine like terms: $17+x=25$. Subtract 17 from both sides, and you find that $x=8$.

## Chapter 26 <br> Practice Test 4

# Math Test - No Calculator <br> 25 MINUTES, 20 QUESTIONS 

Turn to Section 3 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-15, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 16-20, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 16 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is not permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$A=\pi r^{2}$
$C=2 \pi r$

$V=\ell w h$

$V=\pi r^{2} h$

$V=\frac{4}{3} \pi r^{3}$

$V=\frac{1}{3} \pi r^{2} h$

$V=\frac{1}{3} \ell w h$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

1

David is planning a dinner for his birthday. At one restaurant, the cost per person for dinner is $\$ 15$, with an additional one-time set-up charge of $\$ 35$. David has a maximum budget of $\$ 150$. If $p$ represents the number of people (including David) who will attend the dinner, which of the following inequalities represents the number of people who can attend within budget?
A) $15 p \leq 150+35$
B) $35 \leq 150-15 p$
C) $15 p \geq 150-35$
D) $35 \geq 150-15 p$

2
When a virus breaks out, each infected person can infect multiple new people. In a particularly bad flu outbreak at an elementary school, the number of infected people triples each day in the first school week of January. If 5 people were sick with the flu on Monday, which of the following equations best predicts the number of infected people, $I(d), d$ days after Monday?
A) $I(d)=5 \times 3 d^{2}$
B) $I(d)=5 d^{3}$
C) $I(d)=5 \times 3^{d}$
D) $I(d)=5 \times 9 d$

## 3

During the month of July, the number of units, $y$, of a certain product sold per day can be modeled by the function $y=-3.65 x+915$, where $x$ is the average daily temperature in degrees Fahrenheit. Which of the following statements must be true?
A) As the temperature increases, the number of units sold decreases.
B) As the temperature increases, the number of units sold remains constant.
C) As the temperature increases, the number of units sold increases.
D) There is no linear relationship between temperature and the number of units sold.

Newton's law of gravitation describes the strength of the force $F$ between two objects with masses $M$ and $m$ separated by a distance of $r$ units and is defined as $F=\frac{G M m}{r^{2}}$. Which of the following gives the value of Newton's gravitational constant $G$, in terms of $F, M$, $m$, and $r$ ?
A) $G=F r^{2} \mathrm{Mm}$
B) $G=\frac{F r^{2}}{M m}$
C) $G=\frac{F M m}{r^{2}}$
D) $G=\frac{F}{r^{2} M m}$

5
Which of the following expressions is equivalent to $(4 s)^{\frac{1}{3}}$ ?
A) $\frac{2}{\sqrt{s}}$
B) $\frac{1}{12 s^{3}}$
C) $2 \sqrt{s}$
D) $\sqrt[3]{4 s}$

6
If $A$ and $B$ both lie on a circle with an area of $16 \pi$, and the length of $\overparen{A B}$ is $2 \pi$, what is the radian measure of the central angle between $A$ and $B$ ?
A) $\frac{\pi}{8}$
B) $\frac{\pi}{4}$
C) $\frac{\pi}{2}$
D) $\frac{2 \pi}{3}$

Oil is being drained from an oil tank at a constant linear rate. Four hours after draining of the tank began, the volume of oil in the tank was 740 gallons, and seven hours after draining of the tank began, the volume was 545 gallons. Which of the following functions best models $v(t)$, the volume of oil in the tank, in gallons, $t$ hours after draining of the tank began?
A) $v(t)=740-t$
B) $v(t)=740-65 t$
C) $v(t)=1000-195 t$
D) $v(t)=1000-65 t$

8
What is the result of multiplying $8 s^{2}-6 s+2$ by $4 s-1$ ?
A) $14 \mathrm{~s}-2$
B) $16 s^{2}+2 s+2$
C) $32 s^{3}-16 s^{2}+2 s+2$
D) $32 s^{3}-32 s^{2}+14 s-2$

If the equation for a parabola is $y=5(x-3)^{2}-3$, which of the following points represents the parabola's vertex?
A) $(3,-3)$
B) $(3,0)$
C) $(0,-3)$
D) $(-3,3)$

10

$$
\left(\frac{3}{c+2}\right)(c+2)=\left(5-\frac{c}{c+2}\right)(c+2)
$$

In the equation above, what is the value of $c$ ?
A) -4
B) $-\frac{7}{4}$
C) $-\frac{7}{5}$
D) $\frac{1}{5}$

11

In the figure above, $O$ is the center of the circle and the diameter is 10 . If the area of the shaded region is $\pi$, what is the length of minor arc $X Y$ ?
A) $\frac{2 \pi}{5}$
B) $\frac{4 \pi}{5}$
C) $\frac{5 \pi}{2}$
D) $5 \pi$

12

$$
\begin{array}{r}
x+3 y=42 \\
3 x-y=8
\end{array}
$$

In the system of equations above, how many points of intersection do the equations share and what is their relationship, if any?
A) Zero, and the lines are parallel.
B) Infinitely many, and the lines are the same line.
C) One, and the lines have no relationship.
D) One, and the lines are perpendicular.

The figure above shows the graph in the $x y$-plane of the function $f$. If $q, r, s$ and $t$ are distinct real numbers, which of the following could be $f(x)$ ?
A) $f(x)=(x-q)^{2}$
B) $f(x)=(x-r)(x+s)$
C) $f(x)=(x-r)(x+s)(x+t)$
D) $f(x)=(x-q)(x-r)(x+s)(x+t)$

A 40 -foot tall arch with a parabolic shape has a line drawn between the bases of the two legs of the arch. If the height above the ground, $y$, of the arch can be written as the function $y(x)=a(x-20)(x+20)$, where $x$ represents the horizontal distance along the line between the bases from a point on the ground directly under the highest point of the arch, then what is the value of negative constant $a$ ?
A) $-\frac{1}{40}$
B) $-\frac{1}{20}$
C) $-\frac{1}{10}$
D) -20

The graph of $f(x)$ is shown in the $x y$-plane above. Which of the following could be the graph of $-[f(x-2)+3] ?$
A)

B)

C)

D)

16
18

$$
h(t)=\frac{1}{2} a t^{2}
$$

As a space probe descends to the surface of Mars, its distance in meters above the surface can be modeled by the equation above. If $t$ is the time in seconds it will take the probe to reach the surface, and it takes the probe 8 seconds to descend the final 120 meters to the surface, what is the value of the deceleration constant $a$ ?

A rectangular box has a volume of 24 . If the length is halved and the height is tripled, what will be the new volume of the box?

If $6 e(e+3)=3 e(2 e+4)+5$, what is the value of $e$ ?

Abeena is making punch for a winter party in a punch bowl that can hold at most 9 quarts. She wants to get as much vitamin C in her punch as possible, so she is using only orange juice and grape juice. She has 6 quarts of orange juice, which has 2 grams of vitamin C per quart, and 7 quarts of grape juice, which has 1 gram of vitamin $C$ per quart. If there are 4 cups in a quart, what is the greatest possible amount of vitamin C, in grams, that Abeena can have in one cup of her punch?

If you finish before time is called, you may check your work on this section only. Do not turn to any other section in the test.

## Math Test - Calculator

## 55 MINUTES, 38 QUESTIONS

Turn to Section 4 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-30, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 31-38, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 31 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is permitted.

$$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

4

1
If $16 a^{2}+4 a-6=0$, what is a possible value of $a$ ?
A) -0.75
B) -0.5
C) 0
D) 1

2
In order to make a profit, a zoo needs to sell at least 350 admission tickets each day. Four student groups, each of which includes 48 students, have purchased tickets for admission. If $z$ represents the number of additional tickets sold today, and the zoo made its daily profit goal, which of the following inequalities could represent all possible values for $z$ ?
A) $4(48)+z \leq 350$
B) $4(48)+z \geq 350$
C) $4(48)-z \leq 350$
D) $4(48)-z \geq 350$

## 3

A country's birth rate is the number of births per year per 1,000 people in the country, and a country's death rate is the number of deaths per year per 1,000 people. Immigration refers to the number of people who move into a country each year, and emigration refers to the number of people who move out of the country each year. A country's population growth is determined by these four variables. Table 1 gives birth, death, immigration, and emigration rates in four countries and lines 1-4 in Figure 1 model the population for the four countries shown over time.

|  | Birth | Death | Immigration | Emigration |
| :--- | :--- | :--- | :--- | :--- |
| East Zealand | 20 | $x$ | 1,000 | 1,000 |
| West Zealand | 21 | 21 | 12,100 | $y$ |
| South Zealand | 36 | 24 | $z$ | 500 |
| North Zealand | 13 | 13 | 82,000 | 9,600 |

Line 1 represents which country's population?
A) East Zealand
B) West Zealand
C) North Zealand
D) South Zealand

4

At the start of a new movie at the Cineplex 16, there are 250 people in the theater. However, $10 \%$ of the people walk out of the theater within the first 15 minutes of the movie starting. If another $10 \%$ leave in the next 15 minutes and this rate continues for the duration of the movie, which of the following graphs correctly models the number of people in the theater during the movie?
A)

B)

C)

D)

$$
\frac{6}{2 y}=\frac{y}{12}
$$

Which of the following includes all possible values of $y$ in the equation above?
A) $\{-6\}$
B) $\{-6,6\}$
C) $\{6\}$
D) $\{6,36\}$

## Marathon Times for an All-Ages Running Club

The scatterplot above displays the marathon times of the eight members of a running club in relation to their ages and the line of best fit. How many people have times at least fifteen minutes faster than what would be expected based on the line of best fit?
A) One
B) Two
C) Three
D) Four

## Questions 7 and 8 refer to the following information.

The table below shows the relative investment in alternative energy sources in the United States by type. One column shows the relative investment in 2007 of $\$ 75$ million total invested in alternative energy. The other column shows the projected relative investment in 2017 given current trends. The total projected investment in alternative energy in 2017 is $\$ 254$ million.

## United States Investment in Alternative Energy Sources

|  | Actual 2007 <br> Investment | Projected 2017 <br> Investment |
| :--- | :--- | :--- |
| Biofuels | 0.31 | 0.34 |
| Wind | 0.40 | 0.32 |
| Solar | 0.27 | 0.30 |
| Fuel Cells | 0.02 | 0.04 |
| Total | 1.00 | 1.00 |

7
Based on the information in the table, if an investment was made in alternative energy in 2007, what is the probability that the money was invested in wind resources?
A) $\frac{1}{25}$
B) $\frac{3}{10}$
C) $\frac{2}{5}$
D) $\frac{3}{5}$

Based on the information in the table, which of the following statements is the most accurate?
A) The value of the 2007 investment in biofuels was approximately $\$ 50$ million.
B) The portion of total alternative energy investment focused on wind sources is projected to decrease by $8 \%$ in 2017.
C) The dollar amount invested in fuel cells in 2007 is projected to double in 2017.
D) The top three types of alternative energy were invested in more equally in 2007 than they are projected to be in 2017.

9
Monster Truck Inc. leases a new truck for a down payment of $\$ 3,200$ plus monthly payments of $\$ 380$ per month for 36 months. Which of the following functions $f$ represents the total amount paid, in dollars, after $m$ months, where $0 \leq m \leq 36$ ?
A) $f(m)=380+3,200 m$
B) $f(m)=3,200+36 m$
C) $f(m)=3,200+380 m$
D) $f(m)=10,480-380 m$

## 10

What is the equation of a line that contains the point $(6,-5)$ and has an $x$-intercept of 3 ?
A) $y=-\frac{5}{3} x+5$
B) $y=-\frac{4}{3} x+3$
C) $y=-\frac{3}{5} x+3$
D) $y=\frac{5}{3} x+5$

11
A single frame of 35 mm film is about three-quarters of an inch long. A film reel holds up to 1,000 feet of film. How many reels are required for a two-hour, forty-seven minute film shot at 24 frames per second?
A) 13
B) 14
C) 15
D) 16

## 12

Hua needs to receive completed surveys from at least 3,800 potential voters in her city. She has noticed that for every 5 surveys she sends out, only 1 survey is completed. Last week she received 1,350 completed surveys, and this week she received 900 completed surveys. Hua plans to send out $s$ additional surveys. Which of the following inequalities shows all possible values for $s$ that would ensure that Hua receives 3,800 completed surveys?
A) $s \geq 1,550$
B) $s \geq 2,250$
C) $s \geq 7,750$
D) $s \geq 12,250$

13

In the figure above $C$ is the midpoint of $\overline{B D}$ and $\overline{A C}=\overline{D E}$. What is the value of $n$ ?
A) 30
B) 45
C) 60
D) Cannot be determined from the information given

Allie is a caterer who is building 4 sandwich platters. Each sandwich platter contains turkey slices that weigh 2 ounces each and bread slices that weigh 1 ounce each. In each platter, she has a total of 100 slices of turkey and bread that weigh a total of 160 ounces. Solving which of the following system of equations yields the number of turkey slices, $t$, and the number of bread slices, $b$, that are in the 4 sandwich platters?
A) $t+b=100$
$2 t+b=160$
B) $t+b=160$ $2 t+b=100$
C) $t+b=400$ $2 t+b=160$
D) $t+b=400$ $2 t+b=640$

15

$$
\begin{aligned}
& 4 a+2 z=10 \\
& -3 a+z=-10
\end{aligned}
$$

Based on the system of equations above, what is the value of $10 a$ ?
A) -10
B) -1
C) 3
D) 30

4

16
Isabella has $\$ 1,000$ to invest and explores a number of options at her local bank. After learning about her options, she decides to deposit her $\$ 1,000$ into a highyield savings account that compounds at an annual rate of $4 \%$, compounded quarterly. The banker tells Isabella that her projected earnings in dollars, $P$, as a function of time in years, $t$, can best be represented by the equation $P(t)=1000(1.01)^{4 t}$. Which of the following graphs best illustrates Isabella's projected earnings over time?
A)

B)

C)

D)

Dahlia is competing in a group stair-climbing relay challenge with two of her friends. They will take turns climbing the stairs of two of Metropolis's tallest buildings. The three of them each plan to climb an equal number of stairs, and Dahlia will go first. The first building has $s$ stairs, and the second building has 3,639 stairs. During the race, Dahlia runs out of energy and is only able to complete $75 \%$ of her goal. What is the total number of stairs that Dahlia climbs?
A) $0.75\left(\frac{1}{3} s+1,213\right)$
B) $0.75\left(\frac{1}{3} s+3,639\right)$
C) $75\left(\frac{1}{3} s+1,213\right)$
D) $75\left(\frac{1}{3} s+3,639\right)$

19
Thirty-six percent of the 315 million people residing in the United States currently hold a passport.
Of these passport-holding individuals, $8 \%$ travel internationally every year. Of those who travel internationally every year, approximately $10 \%$ visit European countries. How many U.S. residents visit European countries every year?
A) 9,072
B) 90,720
C) 907,200
D) $9,072,000$

## 20

If the third degree polynomial $x^{3}-10 x^{2}+12 x+72$ can be factored to $(x+2) \cdot y^{2}$, what is $y$ in terms of $x$ ?
A) $x-6$
B) $x-3$
C) $x-1$
D) $x+1$

21

| Year | North <br> District | Central <br> District | South <br> District |
| :--- | :--- | :--- | :--- |
| 2000 | 565 | 495 | 1023 |
| 2002 | 552 | 445 | 980 |
| 2004 | 503 | 376 | 924 |
| 2006 | 455 | 365 | 887 |
| 2008 | 406 | 278 | 842 |
| 2010 | 354 | 225 | 757 |
| 2012 | 343 | 201 | 624 |
| 2014 | 364 | 176 | 596 |

To better measure the effects of increases in poaching, the nation of Wakanda began a study in 2000 to track the number of elephants in each of the country's three administrative districts. Every two years, researchers performed a count of the number of elephants in each region; these counts were performed in January. The table above shows the results of the study.

Researchers determine that at a 95\% confidence level, their margin of error for the population of elephants in 2010 was 17.4. If the actual population in 2010 is within the confidence interval, what is the lowest possible population of elephants in Wakanda in 2010 ?
A) 1,317
B) 1,318
C) 1,319
D) 1,320

4

22

Figure I

Figure II

Figure III

In figures I and II above, two stacks of identical carpenter's sawhorses are shown, with heights of 92 and 60 inches, respectively. The height, in inches, of a stack of $k$ sawhorses is given by the function $h(k)=16 k+12$, where $k$ is a positive integer and $k \geq 1$. The number 12 in the function represents which of the dimensions shown in Figure III ?
A) $a$, the height of one sawhorse
B) $b$, the distance from the bottom of one sawhorse to the bottom of the next highest sawhorse
C) $c$, the distance from the top of one sawhorse to the bottom of the next highest sawhorse
D) $d$, the width of a sawhorse at the top

23

In the figure above, if $\sin a=\cos b$, which of the following is closest to the length of $\overline{D F}$ ?
A) 5.6
B) 8.7
C) 11.2
D) 12

4

24

|  | Widgets | Hours | Breaks |
| :--- | :--- | :--- | :--- |
| Rick | 28 | 4 | 2 |
| Darryl | 42 | 6 | 4 |
| Shane | 27 | 5 | 2 |

Rick, Shane, and Darryl work at a widget factory. The table above shows the number of hours they each spent at the factory on a given day, the number of widgets they produced, and the number of 15 -minute breaks they took while they were at the factory. Each man works at a constant rate.

Rick and Shane are each assigned an equal number of widgets. Neither will take breaks in order to complete this assignment as quickly as possible. Rick offers to do a certain percentage of Shane's assignment so that they both finish at the same time. What percentage of Shane's original assignment does Rick do?
A) $12.5 \%$
B) $14.3 \%$
C) $16.7 \%$
D) $25 \%$

25

The graph above represents the effect of efforts to reintroduce Chrysocyon brachyurus, a wolf-like predator, to Uruguay. It tracks the population of both Chrysocyon brachyurus and Sylvilagus brasiliensis, the rabbit species that is a primary food-source.

For which of the following periods did the Sylvilagus brasiliensis population undergo the greatest percent decrease?
A) '91-'92
B) ' $93-195$
C) ' $99-100$
D) ' $00-101$

26

$$
\begin{aligned}
& y=x^{2}-2 x \\
& y=2 x-1
\end{aligned}
$$

This system has two solutions for $(x, y)$. What is the larger value of $x$ ?
A) $2-\sqrt{3}$
B) $\sqrt{3}$
C) $2+\sqrt{3}$
D) 5

27
If $\csc \theta=1.66$, then $\tan \theta=$
A) 0.60
B) 0.76
C) 1.32
D) 1.76

28

| 184 | 176 | 181 | 157 | 168 |
| :--- | :--- | :--- | :--- | :--- |
| 154 | 148 | 165 | 190 | 162 |

A group of patients is recruited for a clinical trial. Their heights, recorded in centimeters, are listed in the table above. Two more patients are recruited to the study. After these patients join, the mean height is 169 cm . Which of the following could be the heights of the two new patients?
A) 146 cm and 177 cm
B) 150 cm and 188 cm
C) 165 cm and 177 cm
D) 157 cm and 186 cm

29
What is the equation of the line that passes through the point $(2.75,0.975)$ and has an $x$-intercept of 2 ?
A) $y+5.9=2.5 x$
B) $4 y+12 x=29.1$
C) $6 y+27.15=12 x$
D) $10 y-13 x=-26$

A bacteria population, $P$, can be modeled by the equation $P=P_{0} 10^{k t}$, where $P_{0}$ is the bacteria population at the beginning of the experiment, $t$ is the time in hours since the beginning of the experiment, and $k$ is a positive constant. Which of the following gives the time, $t$, in terms of $k, P$, and $P_{0}$ ?
A) $t=\frac{\log \left(\frac{P_{0}}{P}\right)}{k}$
B) $t=\frac{\log \left(\frac{P}{P_{0}}\right)}{k}$
C) $t=\frac{\log \left(P \times P_{0}\right)}{k}$
D) $t=k \log \left(\frac{P}{P_{0}}\right)$

31
Dan orders a soccer jersey online. If the jersey costs 40 euros and one euro is worth 1.2 dollars, how many dollars did Dan pay for the jersey?

32
An ice cream cart vendor sells 50 popsicles on an average fall day. During the summer, the ice cream cart vendor sells 7 less than twice as many popsicles per day than he does on the average fall day. How many popsicles does the ice cream cart vendor sell in 6 summer days?

33

$$
\begin{aligned}
& 1.3 g+1.7 h=5 \\
& 3 h=20+13 g
\end{aligned}
$$

Based on the system of equations above, what is the value of $h$ ?

34

|  | Candidate <br> A | Candidate <br> B | Undecided | Total |
| :--- | :---: | :---: | :---: | :---: |
| Democrat | 24 | 56 | 70 | 150 |
| Republican | 117 | 70 | 50 | 237 |
| Independent | 15 | 18 | 80 | 113 |
| Total | 156 | 144 | 200 | 500 |

The table above illustrates the results of a political poll. Five hundred voters were first asked whether they were registered as Democrat, Republican, or Independent. The voters were then asked whether they planned to vote for Candidate A, for Candidate B, or were Undecided. What percent of the registered Democrats plan to vote for Candidate A ? (Disregard the percent symbol when gridding your answer.)

35

$$
\begin{aligned}
x & \geq 0 \\
3 y-2 x & \geq-12 \\
2 x+5 y & \leq 20
\end{aligned}
$$

What is the area of the triangle formed in the $x y$ plane by the system of inequalities above?

## 36

When $\left(x^{2}+2 x-3\right)(2 x+5)-(x+1)(x-1)(x+3)$ is expressed in the form $a x^{3}+b x^{2}+c x+d$, what is the value of $a+b+c+d$ ?

## Questions 37 and 38 refer to the following information.

Nile is a track \& field athlete at North Sherahan High School. He hopes to qualify for the Olympic Games in his best field event, the javelin throw. He experiments with different javelin weights to build his arm strength and currently measures the results in feet.

## 37

The distance at which Nile can throw a javelin is inversely proportional to the weight of that javelin. Nile can throw a 1.5 pound javelin exactly 260 feet. How far would Nile be able to throw a two pound javelin, in feet, assuming all other factors remain constant? (Disregard units when inputting your answer.)

38
During his preparations, Nile realizes that the upcoming Olympic qualifying competition will be judged in meters, rather than feet or yards. Nile wants to make sure he can throw the javelin the minimum required distance so he can advance in the competition. If his current best throw is 60 yards, and one yard is approximately 0.9144 meters, how much further, to the nearest yard, must he throw in order to achieve the minimum required distance of 68.58 meters to qualify for the Olympics? (Disregard units when gridding your answer.)

## STOP

If you finish before time is called, you may check your work on this section only. Do not turn to any other section in the test.

## Section 3: Math (No Calculator)

1. B Subtract the one-time set-up charge from David's budget first: $150-35=115$. Calculate the number of people David can invite as follows: $115 \div 15=7 . \overline{6}$. David can invite at most 7 people (including himself), so $p \leq 7$. In (A), $15 p \leq$ 185 , so $p \leq 12 . \overline{3}$ or $p \leq 12.3$. Eliminate (A). Solve for $p$ in (B) as follows: add $15 p$ to both sides to get $15 p+35 \leq 150$, so $15 p \leq 115$ and $p \leq 7 . \overline{6}$. The correct answer is (B).
2. C Whenever there are variables in the question and in the answer choices, think Plugging In. Let $d=2$. On the first day after Monday, $5 \times 3=15$ people will be infected. On the second day after Monday, $15 \times 3=45$ people will be infected. Therefore, when $d=2$, the result is 45 . Plug 2 in for $d$ in the answer choices to see which answer equals the target number of 45 . Choice (A) becomes $5 \times$ $3\left(2^{2}\right)=5 \times 12=60$. This does not match the target number, so eliminate $(A)$. Choice (B) becomes $5 \times 2^{3}=40$. Eliminate (B). Choice (C) becomes $5 \times 3^{2}=$ 45. Keep (C), but check the remaining choice just in case. Choice (D) becomes $5 \times 9(5)=225$. Eliminate (D), and choose (C).
3. A Whenever there are variables in the question, think Plugging In. The answers refer to what happens when the temperature, $x$, increases, so plug in more than one value of $x$. Plug in $x=1$ into the equation to get $y=-3.65(1)+915=$
$-3.65+915=911.35$. Next plug in $x=2$ to get $y=-3.65(2)+915=-7.3+915$ $=907.7$. As average daily temperature, $x$, increased, the number of units sold, $y$, decreased. Therefore, the correct answer is (A).
4. B Plugging In could work on this one, but calculators aren't permitted. Since the equation is fairly simple, solving may be a better approach. Multiply both sides of the equation by $r^{2}$ to get $F r^{2}=G M m$. Divide both sides of the equation by $M m$ to get $\frac{\mathrm{Fr}^{2}}{M m}=G$. The correct answer is (B).
5. D Taking a number to the $\frac{1}{3}$ power is the same as taking the cube root of the number. Therefore, (4s) $\frac{1}{3}=\sqrt[3]{4 s}$. The correct answer is (D). A shortcut is to just raise the coefficient to the power, and then use POE. Since only one answer starts with $\sqrt[3]{4}$, that one must be correct. Another approach is to plug in a number for $s$ and let the calculator do the hard work, though that would not help in this section since calculator use is not permitted.
6. Cketch a picture and write the formulas for arc length and area: $s=r \theta, A=\pi r^{2}$. Start by finding the radius. If the circle has an area of $16 \pi$, then $16 \pi=\pi r^{2}$; divide both sides by $\pi$ to get $16=r^{2}$. The radius must be 4 . So plug in the arc length and radius into your formula: $2 \pi=4 \theta$. Divide both sides by 4 to get $\frac{\pi}{2}=$ $\theta$. Choice (C) is correct.
7. D According to the question, if $t=4$, then $v(t)=740$. Plug 4 in for $t$ in the answer choices and see if $v(\mathrm{t})$ comes out to the target number 740. In (A) if $t=4$, then $v(t)=740-4=736$. Eliminate (A). In (B), if $t=4$, then $v(t)=740-65(4)=$ $740-260=480$. Eliminate (B). In (C), if $t=4$, then $v(t)=1,000-195(4)=$ $1,000-780=220$. Eliminate (C). The correct answer must therefore be (D).
8. D Whenever there are variables in the question and in the answers, think Plugging In. If $s=2$, the first expression becomes $8\left(2^{2}\right)-6(2)+2=8(4)-12$ $+2=32-12+2=22$. Therefore, the first expression multiplied by the second
expression is $22(7)=154$. Plug in 2 for $s$ in the answers to see which choice equals the target number of 154 . Choices (A), (B), and (C) yield 26,70 , and 198 respectively. Choice (D) yields 154 and is the correct answer.
9. A Whenever the question includes variables and the answers are numbers, think Plugging In the Answers. In (A), $x=3$ and $y=-3$. Plug these numbers into the equation to get $-3=5(3-3)^{2}-3$. Solve the right side of the equation to get $-3=5(0)^{2}-3$ or $-3=0-3$. The correct answer is (A). None of the other points work when plugged into the equation, so eliminate (B), (C), and (D).
10. B Plugging In would not be straightforward for this problem, given the fractions and negative numbers. A better approach would be to simplify the expressions first and then plug in or solve. Distribute the $(c+2)$ term to both sides of the equation. On the left side, this will cancel out with the $(c+2)$ term in the denominator. On the right side, make sure to distribute the $(c+2)$ to both terms inside the parentheses. The equation becomes $\frac{3(c+2)}{c+2}=5(c+2)-$ $\frac{c(c+2)}{c+2}$ or $3=5 c+10-c$. Combine the $c$ terms and subtract 10 from both sides to get $-7=4 c$. Divide both sides by 4 to find that $c=-\frac{7}{4}$. The answer is (B).
11. A Since the diameter is 10 , the radius must be $5 \cdot A=\pi r^{2}$, so $A=25 \pi$. The shaded region takes up $\frac{\pi}{25 \pi}$ or $\frac{1}{25}$ of the area, so minor arc $X Y$ must take up $\frac{1}{25}$ of the circumference. $C=\pi d$ so $C=10 \pi$. Therefore, the length of minor $\operatorname{arc} X Y$ is $\frac{1}{25}$ (10л), or $\frac{2 \pi}{5}$, which is (A).
12. D First, rewrite the equations so that they are in the slope-intercept form of a line, $y=m x+b$, where $m=$ slope. The first equation becomes $3 y=-x+42$ or $y=-\frac{1}{3} x+14$. The slope of this first line is therefore $-\frac{1}{3}$. The second equation becomes $-y=-3 x+8$ or $y=3 x-8$. The slope of this line is therefore 3 . The
slopes of the two lines are negative reciprocals of each other, which means that the two lines are perpendicular to each other. The correct answer is (D).
13. $\mathbf{C}$ The graph crosses the $x$-axis at three distinct points. When the function is set to o, there should be three real solutions for $x$. Use Process of Elimination to solve this question. Set the equation in (A) to o to get $0=(x-q)^{2}$. In this equation, the root is at $x=q$, thereby providing only one real value for $x$. Eliminate (A). Set the equation in (B) to o to get $0=(x-q)(x+s)$. The solutions for this equation are $x=q$ or $x=-s$. Therefore, there are only two real solutions for $x$. Eliminate (B). Set the equation in (C) to o to get $\mathrm{o}=(x-$ $r)(x+s)(x+t)$. The solutions for this equation are $x=r, x=-s$, and $x=-t$. Therefore, there are three real solutions for $x$. The correct answer is (C).
14. C When the quadratic is set to o the parabola crosses the $x$-axis at $(-20,0)$ and $(20,0)$. Because parabolas are symmetrical, the vertex of the parabola is at ( 0 , 40). Plug this point into the equation to get $40=a(0-20)(0+20)$. Simplify the right side of the equation to get $40=a(-20)(20)$ or $40=-400 a$. Solve for $a$ to get $a=-\frac{40}{400}=-\frac{1}{10}$. Therefore, the correct answer is (C).
15. B The line shown has a negative slope. Because the graph transformation asks for the negative value of the transformed function, the resulting graph must have a positive slope. Therefore, eliminate (A). Graph transformation rules state that if the number is within the parentheses, then the graph moves left or right in the opposite direction of the sign, and if the number is outside the parentheses, the graph moves up or down in the same direction of the sign. Therefore, this line will move 2 to the right, and up 3 . To follow the proper order of operations, draw out the graph transformation first, and then deal with the negative outside the brackets. Move the line two units to the right to get:

Move the line up 3 to get:

The negative sign outside the brackets means to reflect, or flip, the line over the $x$-axis. When the line is flipped from a positive to a negative slope, it will still go through point ( 4,0 ). Therefore, the correct answer is (B).
16. $\frac{15}{4}$

## or 3.75

According to the question, $h(t)=120$ and $t=8$. Plug these values into the function to get $120=\frac{1}{2} a\left(8^{2}\right)$. Simplify the equation to get $120=\frac{1}{2} a(64)$ and $120=32 a$. Solve for $a$ to get $a=3.75$. The correct answer is 3.75.
17. 2 Whenever there are two equations with the same two variables, they can be solved simultaneously by adding or subtracting them. The key is to get one variable to disappear. Multiply the first equation by 3 to get $9 h-3 j=21$. Stack the equations and add them.

$$
\begin{aligned}
9 h-3 j & =21 \\
\underline{2 h+3 j} & =1 \\
11 b \quad & =22
\end{aligned}
$$

Therefore $h=2$, and the correct answer is 2 .
18. 36 Plug in. Pick any values for the length, width, and height that will give you a volume of 24 . If you say the length is 2 , the height is 3 , and the width is 4 , then the new length, height, and width will be 1,9 , and 4 respectively. The new volume is 36 . No matter what numbers you set for the initial length, width, and height, you will always get 36 for the new volume.
19.
20.

## $\frac{5}{6}$ or 0.833

Distribute the $6 e$ on the left side of the equation and the $3 e$ on the right side of the equation to get $6 e^{2}+18 e=6 e^{2}+12 e+5$. Subtract $6 e^{2}$ from both sides of the equation to get $18 e=12 e+5$. Solve for $e$ to get $6 e=5$, so $e=\frac{5}{6}$. The correct answer is $\frac{5}{6}$.

## $\frac{5}{12}$ or 0.416 or 0.417

Start by calculating the amount of vitamin C in the entire punch bowl and then calculate what the equivalent in only one cup would be. To maximize the amount of vitamin C in the punch bowl, Abeena will need to add as much orange juice, which has the highest concentration of vitamin C , as she can. Given that the punch bowl holds 9 quarts, she will pour in 6 quarts of orange juice (which is all she has) and 3 quarts of grape juice. The amount of vitamin C can be calculated as follows:

|  | Orange Juice | Grape Juice | Total |
| :--- | :---: | :---: | :---: |
| \# of quarts | 6 | 3 | 9 |
| Amount of vitamin C per quart | 2 | 1 |  |
| Total vitamin C | 12 | 3 | 15 |

Therefore, the 9 quarts of punch contains 15 grams of vitamin C. Next, convert the quarts to cups. The question tells us that there are 4 cups in 1 quart. Therefore, $9 \times 4=36$ cups in 9 quarts. To figure out how much vitamin C is in one cup, set up the following proportion: $\frac{15 \text { grams }}{36 \text { cups }}=\frac{x \text { grams }}{1 \text { cup }}$. Cross-multiply to get $36 x=15$, or $x=\frac{15}{36}=\frac{5}{12}$. The correct answer is $\frac{5}{12}$. Only reduce a fraction if it is necessary to make it fit in the grid-in box.

## Section 4: Math (Calculator)

1. A Whenever the question asks for a specific value and the answer choices are numbers, think Plugging In the Answers. In (A), $a=-0.75$. Plug -0.75 in for $a$ in the equation to get $16(-0.75)^{2}+4(-0.75)-6=0$. Solve the left side of the equation to get $16(0.5625)+(-3)-6=0$, or $9-3-6=0$. Since, this statement is true, the correct answer is (A).
2. B So far the zoo has sold $4 \times 48=192$ tickets. To make a profit, the zoo will need to sell at least $350-192=158$ additional tickets. So, $z$ needs to be at least 158 . Calculate $z$ in each of the answers to see which gives you a value of $z \geq 158$. In (A), $z \leq 350-4(48)$, so $z \leq 158$. Eliminate (A). Choice (B) gives you $z \geq 158$. Keep (B). Choice (C) gives you $z \geq-158$. Eliminate (C). Choice (D) gives you $z$ $\leq-158$. Eliminate (D). Choice (B) is the correct answer.
3. D Line 1 shows exponential growth, because the line curves upward. Because birth rate and death rate are per 1,000 people, a birth rate higher than a death rate will result in exponential growth (because births-deaths will increase as the population increases). Immigration and emigration numbers are per year and therefore have a linear effect on the graph (as the absolute change in the population due to immigration-emigration is constant). South Zealand has
more births per 1,000 than deaths per 1,000, so (D) accurately reflects line 1.
4. A You can start with Process of Elimination. Since the number of people in the theater decreases over time, you can eliminate (D). Choices (A) and (B) are exponential functions, whereas ( C ) is linear. The number of people that leave the theater every 15 minutes is not constant, since it is proportional to the number of people currently in the theater; therefore, this function is not linear, and you can eliminate (C). Choice (A) must be correct since the function decreases quickly and then the number leaving every successive 15 minutes is less than the time before ( $10 \%$ of 250 is more than $10 \%$ of 225 ).
5. B Cross-multiply to get $2 y^{2}=72$. Solve for $y$ to get $y^{2}=36$, so $y \pm 6$. Another way to solve would be to Plug In the Answers, since the question asks for a specific value and there are numbers in the answer choices. In (A), $y=-6$. Plug -6 into the equation and see if it works: $\frac{6}{2(-6)}=\frac{-6}{12}$, or $\frac{6}{-12}=\frac{-6}{12}$. Because this statement is true, one of the possible solutions for the equation is $y=-6$. Eliminate (C) and (D) because neither of these answers includes -6 . According to (B), another possible value for $y$ is 6 . Plug 6 into the equation to see if it works: $\frac{6}{2(6)}=\frac{6}{12}$, or $\frac{6}{12}=\frac{6}{12}$. Since this statement is also true, the correct answer is (B).
6. C The 36-year-old runner ran under 3:00:00 when almost 3:30:00 is expected. The 39-year-old runner ran slightly above 3:00:00 when 3:30:00 is expected. The 41-year-old runner ran slightly above 3:00:00 when about 3:45:00 was expected. Therefore, three runners ran at least 15 minutes faster than predicted, which matches (C). If you chose (B), you may have based your choice on the number of runners who ran more than 15 minutes slower than their predicted time.
7. C According to the table, the relative investment in wind resources in 2007 was 0.40 of the total 1.00 . Probability is defined by the number of things that fit the requirements divided by the total number of things. In this case, that
would be $\frac{0.40}{1.00}$. You don't need to worry about the actual dollar values, because these numbers both relate to the same total of $\$ 75$ million. You do, however, need to simplify this fraction. You can multiply it by $\frac{10}{10}$ to get $\frac{4}{10}$, which then reduces to $\frac{2}{5}$. You could also divide it on your calculator to get 0.4 , and then divide each fraction in the answer choices to see which one is also equal to 0.4. Either way, the correct answer is (C).
8. B Examine each answer choice and use Process of Elimination. For (A), the 2007 investment in biofuels was 0.31 out of 1.00 , or about one-third of the total, according to the chart. The total that year was $\$ 75$ million, so the Ballpark value would be about $\$ 25$ million. The $\$ 50$ million value in (A) is too high, so eliminate it. Choice (B) refers to percents, but the chart is in "relative" investment. If the 2007 relative investment in wind is 0.40 out of 1.00 , it is equivalent to $40 \%$ of the total. The wind investment in 2017 is projected to be .32 or $32 \%$ of the total, which is a decrease of $8 \%$. Check out (C) and (D) just to be certain. For fuel cells, the percent of the total is projected to double, but the total in 2017 is projected to be much higher. So the total dollar amount invested in wind in 2017 will be much more than double the 2007 investment. For (D), the top three energy types-biofuels. wind, and solar-are projected to be more equally invested in for 2017 than they were in 2007, so (D) is the opposite of what the chart shows. Eliminate (C) and (D), and choose (B).
9. $\mathbf{C}$ Whenever there are variables in the question and in the answers, think Plugging In. If $m=10$, then Monster Truck Inc., receives a down payment of $\$ 3,200$ plus 10 months' worth of monthly payments. This can be calculated as $3,200+10(380)=3,200+3,800=\$ 7,000$. Plug in 10 for $m$ in the answers to see which function equals 7,000. Choice (A) becomes $f(m)=380+3,200(10)$ $=380+32,000=32,380$. Eliminate (A). Choice (B) becomes $f(m)=3,200+$ $36(10)=3,200+360=3,560$. Eliminate (B). Choice (C) becomes $f(m)=3,200$ $+380(10)=3,200+3,800=7,000$. Keep (C), but check (D) just in case it also works. Choice (D) becomes $f(m)=10,480-380(10)=10,480-3,800=$ 6,680 . Eliminate (D). The correct answer is (C).
10. A Plugging In the point $(6,-5)$ in the answer choices could work, but it will
likely make more than one equation true. The $x$-intercept is where the line crosses the $x$-axis, at the point where $y=0$. Therefore, one point on the line is $(3, o)$. The choices are all in the slope-intercept form, $y=m x+b$, where $m$ is the slope. To find the correct answer, calculate the slope of the line with the two points known to be on the line. The slope of a line is determined by the equation $\frac{y_{2}-y_{1}}{x_{2}-x_{1}}$. Therefore, the slope of the line shown can be calculated as follows: $\frac{-5-0}{6-3}=\frac{-5}{3}$. Only (A) has a slope of $\frac{-5}{3}$, so that is the correct answer.
11. D There are 12 inches in one foot, so a reel is $12 \times 1,000=12,000$ inches long. Set up a proportion to determine how many frames per reel: $\frac{1 \text { frame }}{\frac{3}{4} \text { inch }}=$ $\frac{x \text { frames }}{12,000 \text { inches }}$. Cross-multiply to get $\frac{3}{4} x=12,000$. Divide both sides by $\frac{3}{4}$ to get $x=16,000$ frames per reel. Next, find the number of frames the film requires. Convert the time to seconds. There are 60 minutes in an hour, so 2 hours and 47 minutes is equal to $(2 \times 60)+47=167$ minutes. There are 60 seconds in a minute, so there are $60 \times 10,020$ seconds in this film. If each second consists of 24 frames, then there are $24 \times 10,020=240,480$ frames in this film. To determine the number of reels, divide by the number of frames per reel: $\frac{240,480}{16,000}=15.03$ reels. Because 15 reels does not hold quite enough frames, the film requires 16 reels, which is (D).
12. C So far, Hua has received $1,350+900=2,250$ surveys. Hua needs $3,800-$ $2,250=1,550$ additional surveys. Given that Hua receives 1 completed survey for every 5 she sends out, she will need to send out at least $5 \times 1,550=7,750$ surveys. Therefore, the correct answer is (C).
13. B Since line $A E$ is perpendicular to the line containing segment $A B$ and the line containing segment $D E$, these two lines must be parallel. Therefore, $\angle A B C$ is
equal to $\angle C D E$ because they are both small angles created by a line crossing two parallel lines. Since $\angle D C E$ and $\angle A C B$ are opposite each other, they must be equal as well, so these are two similar right triangles. The question also tells you that $C$ is the midpoint of $B D$, which means that $B C$ and $C D$ are equal. When you have two sides and the included angle of one triangle congruent to two sides and the included angle of a second triangle, you know that the triangles are congruent. This means that $A B=D E$ and $A C=C E$. Lastly, the question states that $A C=D E$, which means that $A B=A C$, and these must be isosceles right triangles. Angle $A B C$ is therefore $45^{\circ}$, and $n$, which is opposite $\angle A B C$, must be $45^{\circ}$ as well. The correct answer is (B).
14. D Start with the easier equation and use Process of Elimination. The easier equation is related to the total number of turkey and bread slides, $t+b$, on the 4 platters. According to the question, each platter contains 100 slices, so the 4 platters contain $100 \times 4=400$ slices. Therefore, one of the equations in the correct answer must be $t+b=400$. Eliminate (A) and (B) since neither of these answers contains that equation. The second equation deals with the weight of the slices. According to the problem, the slices on each platter weigh 160 ounces. Therefore, the total weight of the slices on all 4 platters is $160 \times 4$ $=640$. Eliminate (C) because the total is wrong in the weight equation. The correct answer is (D).
15. D Whenever there are two equations with the same two variables, they can be solved simultaneously by adding or subtracting them. The key is to get one variable to disappear. Multiply the second equation by -2 , to get $6 a-2 z=20$. Stack the two equations and add them.

$$
\begin{aligned}
4 a+2 z & =10 \\
6 a-2 z & =20 \\
10 a & =30
\end{aligned}
$$

Therefore, the correct answer is (D). Be careful of (C)-the question did NOT ask for the value of $a$.
16. B We know that Isabella starts with $\$ 1,000$ in her account, so this eliminates (D). She is earning money from the interest, so the line must have a positive slope, eliminating (C), which has a constant slope. The two best choices are
(A) and (B), but in (A) Isabella's money doesn't begin to increase until the $5^{-}$ year mark, which doesn't make sense-thus (B) is the best choice.
17. A Find a point on the graph and plug that point into each of the answers to see which equation works. The graph goes through the point $(0,-6)$. Using that point, (A) becomes $-6=0^{2}-0-6$. Solve the right side of the equation to get $-6=-6$. Keep (A), but check the remaining answer choices just in case. Choice (B) becomes $-6=0+0-12$. Solve the right side of the equation to get $-6=$ -12. This is not true, so eliminate (B). Choice (C) becomes $-6=0^{2}+6(0)+9$. Solve the right side of the equation to get $-6=9$. Eliminate (C). Choice (D) becomes $-6=0^{2}+5(0)+6$. Solve the right side of the equation to get $-6=6$. Eliminate (D). The correct answer is (A).
18. A The key to this problem is understanding that the three friends plan to climb an equal number of stairs. Start with the building for which we know the number of stairs. The friends are each planning to climb $3,639 \div 3=1,213$ stairs. Since 1,213 must be a part of the correct answer, eliminate (B) and (D). Given that Dalia will complete only $75 \%$ of her goal, Dalia's total must be multiplied by $75 \%$ or 0.75 . This eliminates (C). The correct answer is (A).
19. C Let's break this question into smaller pieces. First, to find the number of U.S. residents who visit European countries every year, we will need to determine how many residents hold passports: $36 \%$ of 315 million $=0.36 \times 315=113.4$ million. Next, we can calculate how many of those passport-holders travel internationally each year: $8 \%$ of 113.4 million $=0.08 \times 113.4=9.072$ million. Finally, we can calculate how many of those international travelers visit Europe each year: $10 \%$ of 9.072 million $=0.1 \times 9.072=0.9072$ million. 0.9072 million is equivalent to 907,200 , which is (C). The percentage calculations can also be done in one step: $0.1 \times 0.08 \times 0.36 \times 315=0.9072$ million.
20. A Given that all of the answer choices are possible values for $y$, plug in the answers. In (A), $y=x-6$. Plug this value into $(x+2) y^{2}$ to get $(x+2)(x-6)(x$ $-6)$. Multiply the last two factors together to get $(x+2)\left(x^{2}-12 x+36\right)$. Multiply the two resulting factors together to get $x^{3}-12 x^{2}+36 x+2 x^{2}-24 x+$ 72. Combine like terms to get $x^{3}-10 x^{2}+12 x+72$. This is the same as the third degree polynomial in the question. Therefore, the correct answer is (A).
21. C In 2010, as counted, there were $354+225+757=1,336$ elephants in

Wakanda. If the margin of error was 17.4, the lowest population of elephants that could fit within the margin of error would be $1,336-17.4=1,318.6$ elephants. Because there cannot be fractional elephants, 1,319 is the smallest value that would be within the margin of error.
22. C Start by using Process of Elimination to eliminate (D) because the entire question is about finding the height, and (D) has nothing to do with height. The difference between the left and middle stacks is 2 stacked sawhorses. The height added to the stack of sawhorses by adding two to the stack can therefore be calculated as $92-60=32$. Therefore, the added height of one stacked sawhorse is $32 \div 2=16$. From this information, keep subtracting the 16 inches added to the top of a stack by each additional sawhorse until you get down to one sawhorse in the stack. If three sawhorses are 60 inches tall, two will be $60-16=44$ inches tall and one sawhorse will be $44-16=28$ inches tall. Choice (A), the height of one sawhorse, can now be eliminated. Another way to think about the height added to the stack of sawhorses by each additional sawhorse is to think of it as the distance between the top of one sawhorse and the top of the next. Since all the sawhorses are the same height, this distance is also the distance from the bottom of one sawhorse to the bottom of the next. Since this distance is 16 , eliminate (B). Therefore, the answer must be (C). The height of one sawhorse is 28 , which is $b+c$, so the overlap, $c$, is $28-16=12$.
23. B Remember that $\sin a=\cos b$ means that $a$ and $b$ are complementary angles. Therefore, the two triangles are similar and $\cos a=\sin b$ as well and you can set up the following equation: $\frac{5}{8}=\frac{7}{E F}$ Now that you have solved for $E F$ (11.2), you can use the Pythagorean theorem $\left(a^{2}+b^{2}=c^{2}\right)$ to solve for $D F .11 .2^{2}=7^{2}$ $+D F^{2}$. The correct answer is (B). Alternatively, you could have used the Pythagorean theorem to solve for $B C$ and then set up a proportion between the similar triangles. Just make sure that you recognize that $A C$ corresponds to $D E$ rather than $D F$.
24. B First, solve for Rick's hourly rate and Shane's hourly rate. Since Work $=$ Rate $\times$ Time, Rick produces 8 widgets per hour ( 28 widgets $\div 3.5$ hours without
breaks) and Shane produces $27 \div 3.5=6$ widgets per hour. Now plug in. Since you know they have a combined rate of 14 widgets per hour, choose a total amount that is divisible by 14. Let's say they were each assigned 14. This means that the total produced is 28 , and at a total rate of 14 per hour. Therefore, it takes them 2 hours to finish. During this time Rick would produce 16 widgets and Shane would produce 12 widgets. Therefore, Rick must have done 2 of Shane's originally assigned 14 widgets, which is $14.3 \%$ of 14 . This matches (B).
25. D To answer this question, you need the formula for percent change: $\frac{\text { difference }}{\text { original }}$. 100. For choice (A), plug in a difference of about 200,000 and an original of about 1,000,000: $\frac{200,000}{1,000,000} \cdot 100$. This simplifies to $20 \%$. For (B), plug in a difference of about 200,000 and an original of about 900,000: $\frac{200,000}{900,000} \cdot 100$. This simplifies to about $22 \%$, so you can eliminate (A). Choice (C) is incorrect because the Sylvilagus brasiliensis population increased during that time. If you chose (C), you may have calculated the percent change of the Chrysocyon brachyurus population. For (D), plug in a difference of about 200,000 and an original of about $800,000: \frac{200,000}{800,000} \cdot 100$. This simplifies to approximately $31 \%$. This is the greatest percent decrease; therefore, (D) is correct.
26. C Start by setting the two equations equal to each other to get $x^{2}-2 x=2 x-1$. Manipulate the equation into the $a x^{2}+b x+c=0$ form, which is $x^{2}-4 x+1=$ o. Use the quadratic equation, which states that $x=\frac{-b \pm \sqrt{b^{2}-4 a c}}{2 a}$ to get $x=$ $\frac{-(-4) \pm \sqrt{(-4)^{2}-4(1)(1)}}{2(1)}$. Solve for $x$ to get $x=\frac{4 \pm \sqrt{16-4}}{2}$, then $x=\frac{4 \pm \sqrt{12}}{2}$ or $x=\frac{4 \pm 2 \sqrt{3}}{2}$, so $x=2 \pm \sqrt{3}$. The greater of the two possible values for $x$ is $x=$ $2+\sqrt{3}$. Therefore, the correct answer is (C).
27. B Cosecant is $\frac{1}{\text { sine }}$ or $\frac{\text { hypotenuse }}{\text { opposite }}$. Make a right triangle and plug in for the side lengths. Because $\frac{\text { hypotenuse }}{\text { opposite }}$, make the hypotenuse 1.66 and the side opposite the angle measure $\theta$ equal to 1 . Use the Pythagorean theorem to solve for the missing side: $1^{2}+x^{2}=1.66^{2} ; 1+x^{2}=2.7556 ; x^{2}=1.7556 ; x \approx 1.32$. Make this the other leg of the triangle. To find $\tan \theta$, use $\frac{\text { opposite }}{\text { adjacent }}: \frac{1}{1.32}$, which is (B).
28. D If two patients are added to the trial, there will be 12 total patients. If the mean height of 12 patients is 169 cm , then the 12 patients have a total height of $12 \times$ $169=2,028 \mathrm{~cm}$. The total height of the first 10 patients is $184+176+181+$ $157+168+154+148+165+190+162=1,685 \mathrm{~cm}$, so the two new patients must have a total height of $2,028-1,685=343 \mathrm{~cm}$. Add up the heights and eliminate any choice that does not equal 343 . Only (D) works.
29. D Plugging in the given point to see which equation is true is not easy on this one, since both values have weird decimals. The answer choices are also likely written so that more than one is true for that point, so try to find another point on the line. The $x$-intercept of a line is where the line crosses the $x$-axis. At that point, the value of $y$ is $o$. Therefore, $(2,0)$ is also a point on the line. Plug this point into the answers, since it is easier to calculate. If it works in more than one equation, plugging in the ugly point will determine the correct answer, which must work for both points work. Plug point $(2,0)$ into (A) to get $0+5.9=2.5(2)$. Solve both sides of the equation to get $5 \cdot 9=5$. Eliminate $(A)$. Plug $(2,0)$ into (B) to get $4(0)+12(2)=29.1$. Solve both sides of the equation to get $4+24=29.1$, or $28=29.1$. Eliminate (B). Plug ( 2,0 ) into (C) to get 6(o) $+27.15=12(2)$. Solve both sides of the equation to get $o+27.15=24$. Since this is clearly not a true statement, eliminate (C). Plug ( 2,0 ) into (D) to get $10(0)-13(2)=-26$. Solve both sides of the equation to get $-26=-26$. Since (D) is the only answer for which the point $(2,0)$ works, the correct answer is (D).
30. B Whenever there are variables in the question and in the answers, think Plugging In. If $P_{0}=4, k=2$, and $t=3$, then $P=(4)(10)^{6}=4,000,000$. Plug these values into the answer choices to see which answer works. Choice (A)
becomes $3=\frac{\log \left(\frac{4}{4,000,000}\right)}{2}$. Simplify the right side of the equation to get 3 $=\frac{\log \left(\frac{1}{1,000,000}\right)}{2}$, then $3=\frac{-6}{2}$, and finally $3=-3$. This isn't true, so eliminate (A). Choice (B) becomes $3=\frac{\log \left(\frac{4,000,000}{4}\right)}{2}$. Simplify the right side of the equation to get $3=\frac{\log (1,000,000)}{2}$, then $3=\frac{6}{2}$, and finally $3=3$. Keep (B), but check the remaining answer choices just in case. Choice (C) becomes $3=$ $\frac{\log (4,000,000 \times 4)}{2}$. Simplify the right side of the equation to get $3=$ $\frac{\log (16,000,000)}{2}$, or $3 \approx 3.6$. Eliminate (C). Choice (D) becomes $3=2 \log$ $\left(\frac{4^{2}}{4,000,000}\right)$. Simplify the right side of the equation to get $3=2 \log$ $\left(\frac{1}{1,000,000}\right)$, then $3=2(-6)$, and finally $3=-12$. Eliminate (D). The correct answer is (B).
31. 48 Set up a proportion: $\frac{1 \text { euro }}{1.2 \text { dollars }}=\frac{40 \text { euros }}{x \text { dollars }}$. Cross-multiply and get $x=1.2 \times 40$ $=48$.
32. 558 During the summer the ice cream vendor sells an average of $2(50)-7=93$ popsicles per day. Over 6 summer days, $93 \times 6=558$ popsicles are sold. The correct answer is 558 .
33. $\frac{7}{2}$ or 3.5

First, get rid of the decimals in the first equation by multiplying the first equation through by 10 to get $13 g+17 h=50$. In the second equation, move all the variables to the left of the equal sign to get $-13 g+3 h=20$. Whenever there are two equations with the same two variables, they can be solved simultaneously by adding or subtracting them. The key is to get one variable to
disappear. Stack the equations on top of each other and add them.

$$
\begin{array}{r}
13 g+17 h=50 \\
-13 g+3 h=20 \\
\hline 20 h=70
\end{array}
$$

Therefore, $h=\frac{70}{20}$. Because this number is too large to grid in, either reduce the fraction to $\frac{7}{2}$, or convert the fraction to the decimal 3.5 .
34. 16 To find the percent of registered Democrats planning to vote for Candidate A, divide the number of Democrats planning to vote for Candidate A by the total number of registered Democrats: $\frac{24}{150}=0.16=16 \%$, which makes 16 the correct answer.
35. 30 Since no picture has been provided, start by drawing the picture. To do so, change each of the equations into the slope-intercept form of an equation $y=$ $m x+b$, where $m$ is the slope and $b$ is the $y$-intercept. The second equation becomes $3 y \geq 2 x-12$, or $y \geq \frac{2}{3} x-4$. The third equation becomes $5 y \leq-2 x+$ 20 , or $y \leq-\frac{2}{5} x+4$. The $\geq \operatorname{sign}$ in the second equation means that everything above the line should be shaded, and the $\leq$ sign in the third equation means that everything below that line should be shaded. To graph the first equation $x$ $\geq 0$, shade everything to the right of the $y$-axis. The resulting picture should look like this:

The formula for the area of a triangle is $A=\frac{1}{2} b \times h$. It is easiest to think of the side that is along the $y$-axis as the base. That side goes from a $y$-coordinate of 4 to -4 , for a length of 8 . The height of the triangle is the $x$-coordinate of the point where the two slanted lines meet; set the two equations equal to find it. Start with $\frac{2}{3} x-4=-\frac{2}{5} x+4$ and multiply everything by 15 to get $10 x-60=-$ $6 x+60$. Then add $6 x$ and 60 to both sides to get $16 x=120$, so $x=7.5$, and the height is 7.5 . The resulting figure should look like this:

Plug the measurements for the base and the height into the area formula to get $A=\frac{1}{2}(8)(7 \cdot 5)=30$. The correct answer is 30 .
36. o Start by multiplying the terms together. To multiply $\left(x^{2}+2 x-3\right)(2 x+5)$, multiply each term in the left parenthesis by each term in the right parenthesis to get $2 x^{3}+5 x^{2}+4 x^{2}+10 x-6 x-15$. Combine like terms to get $2 x^{3}+9 x^{2}+4 x-15$. To multiply $(x+1)(x-1)(x+3)$, do one set of parentheses first; then multiply that product by the remaining parenthesis. You may notice that $(x+1)(x-1)$ is a common quadratic, which equals $x^{2}-1$. Then you need to multiply $x^{2}-1$ by $(x+3)$. As you did before, multiply each term in the first parenthesis by each term in the second to get $x^{3}+3 x^{2}-x-3$. Now you can do $\left(2 x^{3}+9 x^{2}+4 x-15\right)-\left(x^{3}+3 x^{2}-x-3\right)$. It is easiest to distribute the negative sign into the second parenthesis: $\left(2 x^{3}+9 x^{2}+4 x-15\right)+\left(-x^{3}-3 x^{2}+x+3\right)$. Now you can combine like terms to get $x^{3}+6 x^{2}+5 x-12$. This is in the form $a x^{3}+b x^{2}+c x+d$, so $a=1, b=6, c=5$, and $d=-12$. This means $a+b+c+d$
$=1+6+5+(-12)=0$.
37. 195 Use the definition of inverse proportion: $x_{1} y_{1}=x_{2} y_{2}$. Plug in 1.5 for $x_{1}, 260$ for $y_{1}, 2$ for $x_{2}$, and solve for $y_{2}:(1.5)(260)=(2)\left(y_{2}\right) ; 390=2 y_{2}$. Divide both sides by 2 , and you find $y_{2}=195$.
38. 15 Start by converting the qualifying distance of 68.58 meters into yards. Set up a proportion: $\frac{1 \text { yard }}{0.9144 \text { meters }}=\frac{x \text { yards }}{68.58 \text { meters }}$. Cross-multiply to get $0.9144 x=$ 68.58. Divide both sides by 0.9144 to find that the qualifying distance is 75 yards. If his current best is 60 yards, he needs to throw $75-60=15$ more yards.

## SAT <br> Practice Test 5

3

## Math Test - No Calculator

## 25 MINUTES, 20 QUESTIONS

Turn to Section 3 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-15, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 16-20, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 16 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is not permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

1
If $17=3+8 x$, what is the value of $4 x+9$ ?
A) 7
B) 14
C) 16
D) 25

2

Meteorologists in Atlanta have developed the following equation to estimate the temperature $t$, in degrees Fahrenheit, based on the number of hours $h$ after sunrise until 4:00 P.M.:

$$
t=5 h+61.4
$$

According to this model, by how many degrees Fahrenheit will the temperature rise each hour until 4:00 р.м.?
A) 3.3
B) 5
C) 12.3
D) 30.7

3

$$
H=35-4 t
$$

Every day, Lee, a home inspector, is assigned a group of houses needing to be inspected. Lee uses the model above to estimate how many houses he has left to inspect at the end of each hour, where $H$ is the number of houses he has left to inspect and $t$ is the number of hours he has worked so far that day. What does the value 4 represent in this model?
A) The number of hours Lee has to finish all of his assigned houses.
B) The number of houses that Lee has already inspected that day.
C) The number of total houses assigned to Lee to complete that day.
D) The rate at which Lee inspects houses.

## 4

If $y=4(3 x-1)(5 x-1)$ then which of the following is equal to $y$ ?
A) $40 x$
B) $60 x^{2}+4$
C) $60 x^{2}-32 x+4$
D) $45 x^{2}+8$

5
If $\frac{7}{2 x-30}=\frac{2}{x}$, then what is the value of $\frac{x}{2} ?$
A) -20
B) -10
C) 10
D) 15

6

If $4=\frac{y+7}{y-7}$, then $y=$
A) $\frac{5}{21}$
B) $\frac{21}{5}$
C) 7
D) $\frac{35}{3}$

7
Line $l$ passes through the points $(1,3)$ and $(2,5)$, and line $m$ passes through point $(1,4)$ and has a slope of 1 . If lines $l$ and $m$ intersect at point $(a, b)$, then what is the value of $a-b$ ?
A) -3
B) 2
C) 5
D) 7

8
In the $x y$-plane, the parabola with the equation $y=(x+4)^{2}$ intersects the line $y=36$ at two points. What is the distance between those two points of intersection?
A) 6
B) 8
C) 10
D) 12

9

$$
f(x)=-2 x^{2}+c
$$

In the function $f$ above, $c$ is a constant and $f(2)=6$. What is the value of $f(-2)$ ?
A) -6
B) 0
C) 6
D) 10

10

Note: Figure not drawn to scale.

In the figure above, lines $l, m$, and $n$ intersect at a point. If $a+c=b+d$, then which of the following could be FALSE?
A) $b=c$
B) $e=f$
C) $c=f$
D) $a=b$

11

$$
\begin{aligned}
& M=1.35+0.75 y \\
& T=2.25+0.60 y
\end{aligned}
$$

The equations above represent the average price, in dollars, of a cup of coffee in Montreal and Toronto, represented by $M$ and $T$, respectively, $y$ years after 2000. What was the average price of a cup of coffee, in dollars, in Toronto when it was equal to the average price of a cup of coffee in Montreal?
A) 5.85
B) 6.00
C) 6.45
D) 6.60

$$
y=a(x+6)(x-2)
$$

In the quadratic equation above, $a$ is a nonzero constant. The graph of the equation in the $x y$-plane is a parabola with a vertex of $(h, k)$. Which of the following is equivalent to $k$ ?
A) 0
B) $-4 a$
C) $-12 a$
D) $-16 a$

3

13
A line in the $x y$-plane passes through the origin and has a slope of 6 . Which of the following points lies on the line?
A) $(0,6)$
B) $\left(\frac{1}{3}, 2\right)$
C) $(6,0)$
D) $(6,1)$

14
If $a>5$, which of the following is equivalent to

$$
\frac{1}{\frac{1}{a+5}+\frac{1}{a+4}} ?
$$

A) $2 a+9$
B) $\frac{2 a+9}{a^{2}+9 a+20}$
C) $a^{2}+9 a+20$
D) $\frac{a^{2}+9 a+20}{2 a+9}$

15

$$
x^{2}+\frac{1}{2} r=-\frac{q}{3} x
$$

In the quadratic equation above, $q$ and $r$ are constants. What are the solutions for $x$ ?
A) $-\frac{q}{6} \pm \frac{\sqrt{q^{2}-18 r}}{6}$
B) $-\frac{q}{6} \pm \frac{\sqrt{q^{2}-2 r}}{6}$
C) $-\frac{q}{3} \pm \frac{\sqrt{q^{2}-18 r}}{3}$
D) $-\frac{q}{3} \pm \frac{\sqrt{q^{2}-2 r}}{3}$

If $x>0$ and $x^{2}-25=0$, what is the value of $x$ ?

17

In the figure above, $\cos a^{\circ}=\frac{5}{13}$. What is $\sin b^{\circ}$ ?

Note: Figure not drawn to scale.

In the figure above, lines $l$ and $m$ are parallel, $180-2 c=b$, and $c=65$. What is the value of $a$ ?

19

$$
\begin{aligned}
a+3 b & =-10 \\
a+b & =-2
\end{aligned}
$$

In the system of equations above, what is the value of $a$ ?

20

$$
\begin{aligned}
& 2 x+8 y=74 \\
& 3 x-4 y=43
\end{aligned}
$$

If $(x, y)$ is the solution to the system of equations shown above, then what is the value of $y$ ?

## STOP

If you finish before time is called, you may check your work on this section only. Do not turn to any other section in the test.

## Math Test - Calculator

55 MINUTES, 38 QUESTIONS

Turn to Section 4 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-30, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 31-38, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 31 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$A=\pi r^{2}$ $C=2 \pi r$

$A=\ell w$

$A=\frac{1}{2} b h$

$$
A=\frac{1}{2} b h
$$

$c^{2}=a^{2}+b^{2}$

Special Right Triangles

$V=\ell w h$

$V=\pi r^{2} h$

$V=\frac{4}{3} \pi r^{3}$

$$
V=\frac{1}{3} \pi r^{2} h
$$

$V=\frac{1}{3} \ell w h$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

4

1

The graph above shows Casey's distance from home on the second day of a two-day motorcycle trip. During her 5-hour ride home, she stops for 45 minutes for breakfast. Based on the graph, which of the following is closest to the time she stopped for breakfast?
A) 7:00 A.m.
B) $8: 30$ A.м.
C) $10: 15 \mathrm{~A} . \mathrm{m}$.
D) $11: 00 \mathrm{~A} . \mathrm{M}$.

2
The graph below shows the total number of home sales, in thousands, each year from 2002 through 2014.

Based on the graph, which of the following best describes the general trend in home sales from 2002 to 2014?
A) Sales decreased until 2007 and then increased.
B) Sales increased until 2007 and then decreased.
C) Sales generally remained steady from 2002 until 2014
D) Sales decreased and increased in a repeating pattern.

4

3

In the figure above, lines $a$ and $b$ are parallel and lines $p$ and $q$ are parallel. If the measure of $\angle 1$ is $135^{\circ}$, what is the measure of $\angle 2$ ?
A) $45^{\circ}$
B) $105^{\circ}$
C) $120^{\circ}$
D) $135^{\circ}$

4

| $x$ | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: |
| $g(x)$ | 1 | 4 | 7 | 10 |

The table above sows some values for the linear function $g$. Which of the following defines $g$ ?
A) $g(x)=2 x-1$
B) $g(x)=3 x-2$
C) $g(x)=4 x-3$
D) $g(x)=5 x-4$

5
The luminosity, $L$, of a star is determined by the formula $L=4 \pi d^{2} b$, where $d$ represents the distance of the star in meters and $b$ represents the brightness of the star in watts per meter squared. Which of the following equations determines the distance of a star in terms of its luminosity and brightness?
A) $d=\sqrt{\frac{L}{4 \pi b}}$
B) $d=L \sqrt{4 \pi b}$
C) $d=\sqrt{\frac{L b}{4 \pi}}$
D) $d=4 \pi \sqrt{\frac{L}{b}}$

Which of the following graphs best shows a weak positive association between $n$ and $w$ ?
B)

C)

D) $w$

## 7

Last week Salazar played 13 more tennis games than Perry. If they played a combined total of 53 games, how many games did Salazar play?
A) 20
B) 27
C) 33
D) 40
8.

The populations of the six most populous countries in the world in 2015 are shown in the graph above. If the total population of the six countries shown is $3,489,000,000$, what is an appropriate label for the horizontal axis?
A) Population (in billions of people)
B) Population (in millions of people)
C) Population (in thousands of people)
D) Population

Line $l$ has a slope of $m$ and contains points in quadrants I, II, and IV, but no points from quadrant III. Which of the following must be true about the value of $m$ ?
A) $m<0$
B) $m>0$
C) $m=0$
D) Slope $m$ is undefined.

10
The amount of money, $D$, in dollars, remaining in Kabir's bank account $x$ days after payday can be modeled by the equation $D=2,314.05-165.29 x$. Which of the following best describes the meaning of the number 165.29 in the equation?
A) The amount of money withdrawn from Kabir's bank account each day.
B) The amount of money Kabir gets paid each payday.
C) The difference between the amount of money in Kabir's bank account at payday and the amount of money in Kabir's bank account on day $x$.
D) The number of days after payday when no money remains in Kabir's bank account.

## 11

Function $f$ satisfies $f(4)=6$ and $f(6)=5$, and function $g$ satisfies $g(5)=7$ and $g(6)=4$. What is the value of $g(f(6))$ ?
A) 4
B) 5
C) 6
D) 7

4

## Questions 12 and 13 refer to the following information.

| Interface | Coefficient of friction $(\boldsymbol{\mu})$ |
| :--- | :---: |
| skin - metals | 0.90 |
| wood - concrete | 0.62 |
| wood - brick | 0.60 |
| wood - metals | 0.40 |
| wood - stone | 0.30 |
| wood - felt | 0.29 |
| wood - wood | 0.28 |

The chart above shows approximate values for the coefficient of friction, $\mu$, for various combinations of materials. The friction between two objects can be given by the equation $f=\mu N$, where $f$ is friction measured in Newtons, $\mu$ is the coefficient of friction, a dimensionless scalar value dependent on the materials used and expressing the ratio between the friction between the two bodies and the force pressing the two bodies together, and $N$ is the force pressing the two bodies together, in Newtons.

12
Approximately what is the friction, in Newtons, between two pieces of wood being pressed together with a force of 30 Newtons?
A) 8.4
B) 18.6
C) 33.3
D) 107.1

13
The force pressing two stacked objects together is equal to the weight of the object on top. The friction between a piece of wood on a stone surface is 22.5 Newtons. The same piece of wood is placed on another surface, and the friction between the wood and the surface is now 46.5 Newtons. What could be the second surface?
A) metal
B) concrete
C) brick
D) skin 4

$$
\left(1+\frac{0.05}{n}\right)^{n}-1
$$

The expression above gives the effective annual interest rate on a bank account that pays an annual interest rate of $5 \%$, compounded $n$ times per year. Which of the following expressions shows the change in the effective rate on the bank account if the interest is compounded monthly rather than if the interest is compounded quarterly?
A) $\left[\left(1+\frac{0.05}{12}\right)^{12}-1\right]-\left[\left(1+\frac{0.05}{4}\right)^{4}-1\right]$
В) $\frac{\left(1+\frac{0.05}{12}\right)^{12}-1}{\left(1+\frac{0.05}{4}\right)^{4}-1}$
C) $\left(1+\frac{0.05}{\frac{12}{4}}\right)^{\frac{12}{4}}-1$
D) $\left(1+\frac{0.05}{12-4}\right)^{12-4}-1$

## Questions 15 and 16 refer to the following information.

Jack's Total Pay Based on Items Sold

The graph above displays the total amount of pay, $P$, in hundreds of dollars, Jack earns for the sale of $s$ items.

## 15

What does the $P$-intercept represent in the graph?
A) The total number of items Jack sells
B) Jack's base pay
C) The total number of items available for sale
D) The increase in pay Jack receives for each item sold

16
Which of the following represents the relationship between $s$ and $P$ ?
A) $s=2 P$
B) $P=10 s$
C) $P=\frac{3}{2} s+10$
D) $P=\frac{1}{2} s+10$

17
The cost of renting a car at an airport rental company is $\$ 25.50$ per day. Which of the following equations represents the total cost $d$, in dollars, for $w$ weeks of car rental?
A) $d=\frac{25.50}{7 w}$
B) $d=\frac{25.50 w}{7}$
C) $d=25.50(7 w)$
D) $d=25.50 w+7$

## 18

In order to determine if engine oil $E$ will improve gas mileage, a research study was conducted. From a wide range of vehicle makes, models, and model years, 400 vehicles were randomly selected. Half of the vehicles were chosen at random to receive oil $E$, and the other half received a generic brand of oil. The resulting data showed that vehicles that received engine oil $E$ had substantial improvements in gas mileage as compared to those that received the generic brand of engine oil. Which of the following can best be concluded based on the design and results of the research?
A) Engine oil $E$ improves gas mileage better than any other available engine oil.
B) Engine oil $E$ will cause a significant improvement in gas mileage.
C) Engine oil $E$ will improve the gas mileage of any vehicle that uses it.
D) Engine oil $E$ is likely to improve the gas mileage of cars that use it.

4

The complete graph of the function $h$ is shown in the $x y$-plane above. For what value of $x$ is $h(x)$ at its maximum?
A) 1
B) 2
C) 3
D) 4

According to the U. S. Census Bureau, in the United States in 2012 the median household income was $\$ 51,017$, and the average (arithmetic mean) household income was $\$ 71,274$. Which of the following best explains the difference between the median and average household incomes in the United States in 2012?
A) Different households have greatly varying incomes in the United States.
B) Some households in the United States had incomes much greater than the rest.
C) Many households in the United States had incomes between $\$ 51,017$ and $\$ 71,274$.
D) Some households in the United States had incomes much less than the rest.

21
If $2 x-3 \leq 5$, what is the greatest possible value of $2 x+3$ ?
A) 4
B) 8
C) 10
D) 11

## Questions 22 and 23 refer to the following information.

$$
E=\frac{q}{4 \pi \varepsilon_{0} R^{2}}
$$

The electric field strength $E$ at distance $R$ from a single point charge in a vacuum is related to the value of charge $q$ and the electric constant $\varepsilon_{0}$ by the equation above.

22
Which of the following expresses the electric constant in terms of the electric field strength, the value of the charge, and the square of the distance from the charge?
A) $\varepsilon_{0}=\frac{q}{4 \pi R^{2} E}$
B) $\varepsilon_{0}=\frac{E}{4 \pi R^{2} q}$
C) $\varepsilon_{0}=\frac{q E}{4 \pi R^{2}}$
D) $\varepsilon_{0}=\frac{4 \pi R^{2} E}{q}$

## 23

For the same charge $q$, the electric field strength measured at point $X$ is $\frac{1}{25}$ the electric field measured at point $Y$. The distance of point $X$ from the charge is how many times the distance of point $Y$ from the charge?
A) $\frac{1}{5}$
B) 5
C) 25
D) 125

If point $O(5,0)$ is at the center of a circle that contains point $P\left(6, \frac{12}{5}\right)$ on its circumference, which of the following is the equation of circle $O$ in the $x y$-plane?
A) $(x-5)^{2}+y^{2}=\frac{13}{5}$
B) $(x+5)^{2}+y^{2}=\frac{5}{13}$
C) $(x-5)^{2}+y^{2}=\frac{169}{25}$
D) $(x+5)^{2}+y^{2}=\frac{169}{25}$

## 25

Charles is a chemist studying the reaction that produces methyl alcohol under high pressure. He noticed that the actual yield of methyl alcohol from solution $S$ was $25 \%$ less than the actual yield from solution T. Based on Charles's observation, if solution $S$ produced 120 grams of methyl alcohol, how many grams of methyl alcohol did solution $T$ produce?
A) 40
B) 90
C) 145
D) 160

26

Two populations of citrus fruit trees growing in greenhouses are exposed to citrus bacterial canker (CBC) by introducing one infected tree to each population. One population consists of 100 mature orange trees, and the other population consists of 100 mature grapefruit trees. The populations are then left for 30 days. The graph above shows the number of infected trees at 5-day intervals. Which of the following statements correctly compares the average rates at which the two populations become infected with CBC ?
A) In every 5-day interval, the magnitude of the rate of infection of the grapefruit tree population is greater than that of the orange tree population.
B) In every 5-day interval, the magnitude of the rate of infection of the orange tree population is greater than that of the grapefruit tree population.
C) In the intervals from 0 to 5 days and from 5 to 10 days, the rates of infection of the grapefruit trees are of greater magnitude, whereas in the intervals from 20 to 25 days and from 25 to 30 days, the rates of infection of the orange trees are of greater magnitude.
D) In the intervals from 0 to 5 days and from 5 to 10 days, the rates of infection of the orange trees are of greater magnitude, whereas in the intervals from 20 to 25 days and from 25 to 30 days, the rates of infection of the grapefruit trees are of greater magnitude.

The return on investment of a certain company's stock has been modeled with the equation $I=\frac{P T}{\sqrt{1+R}}$ where $I$ is the percent increase in the stock's value, $P$ is the company's annual profits, $T$ is time invested in years, and $R$ is the relative risk rating. Which of the following expressions can be used to determine the relative risk rating of this company's stock?
A) $R=1+\left(\frac{P T}{I}\right)^{2}$
B) $R=\frac{(P T)^{2}}{I^{2}-1}$
C) $R=\left(\frac{P T}{I}\right)^{2}-1$
D) $R=\frac{P T}{I^{2}}-1$

28

$$
\begin{aligned}
& y \geq \frac{x}{2}-5 \\
& y<3 x-2
\end{aligned}
$$

If the above system of inequalities is graphed in the $x y$-plane, which quadrant contains no solutions to the system?
A) Quadrant II
B) Quadrant III
C) Quadrant IV
D) There are solutions in all four quadrants.

4

$$
f(x)=a x^{3}+b x^{2}+c x+d
$$

In the polynomial above, $a, b, c$, and $d$ are constants. If $f(-5)=3$, which of the following must be true about $f(x)$ ?
A) $x-3$ is a factor of $f(x)$.
B) The remainder when $f(x)$ is divided by $x+5$ is 3 .
C) $x+2$ is a factor of $f(x)$.
D) $x+5$ is a factor of $f(x)$.

$$
\begin{aligned}
y & =c x^{2}+d \\
2 y & =10
\end{aligned}
$$

In the system of equations above, $c$ and $d$ are constants. For which of the following values of $c$ and $d$ does the system of equations have no real solutions?
A) $c=-6, d=6$
B) $c=-5, d=4$
C) $c=6, d=4$
D) $c=6, d=5$

4

## 31

At a certain restaurant, milkshakes cost $\$ 4$ and cheeseburgers cost $\$ 6$. If Al buys 1 milkshake and $x$ cheeseburgers and spends at least $\$ 30$ but no more than $\$ 46$, what is one value of $x$ ?

32
A bowl with 300 milliliters of water is placed under a hole where the rain gets in. If water drips into the bowl at a rate of 7 milliliters per minute, then how many milliliters of water will be in the bowl after 50 minutes?

33
Age of the first fourteen Indian Prime Ministers upon taking office

| Prime Minister | Age <br> (years) | Prime Minister | Age <br> (years) |
| :--- | :---: | :--- | :---: |
| Jawaharlal Nehru | 57 | V. P. Singh | 58 |
| Lal Bahadur Shastri | 59 | Chandra Shekhar | 63 |
| Gulzarilal Nanda | 65 | P. V. Narasimha Rao | 69 |
| Indira Gandhi | 48 | Atal Bihari Vajpayee | 71 |
| Morarji Desai | 81 | H. D. Deve Gowda | 63 |
| Charan Singh | 76 | I. K. Gujral | 77 |
| Rajiv Gandhi | 40 | Manmohan Singh | 71 |

The table above shows the ages of the first 14 Indian prime ministers when they began terms in office. According to the table, what is the mean age, in years, of these prime ministers at the beginning of their terms? (Round your answer to the nearest tenth.)

34
In one month, Rama and Siham ran for a total of 670 minutes. If Rama spent 60 fewer minutes running than Siham did, for how many minutes did Siham run?

35

A state highway department uses a salt storage enclosure that is in the shape of a cone, as shown above. If the volume of the storage enclosure is $48 \pi \mathrm{~m}^{3}$, then what is the diameter of the base of the cone, in meters?

36

$$
f(x)=\frac{1}{(x-12)^{2}+14(x-12)+49}
$$

For what value of $x$ is the function $f$ above undefined?

4

## Questions 37 and 38 refer to the following information.

Marginal cost is the increase or decrease in the total cost a business will incur by producing one more unit of a product or serving one more customer. Marginal cost can be calculated using the equation $M=\frac{C_{2}-C_{1}}{Q_{2}-Q_{1}}$, where $M$ is the marginal cost, $C_{1}$ is the total cost for $Q_{1}$ units, and $C_{2}$ is the total cost for $Q_{2}$ units.

At Carol's Steakhouse, the total cost of serving 150 customers per day is $\$ 900$. Carol is interested in increasing her business, but is concerned about the effect on marginal cost.

37
Carol calculates that the total cost of serving 200 customers per day would be $\$ 1,600$. What is the marginal cost of this increase in customers?

38
Carol successfully increases her business to 200 customers per day. However, her total cost for doing so is $50 \%$ greater than the expected $\$ 1,600$. What percent greater is the actual marginal cost than the expected marginal cost, to the nearest full percent? (Note: Ignore the percent sign when entering your answer. For example, if your answer is $326 \%$, enter 326 .)

## STOP

If you finish before time is called, you may check your work on this section only. Do not turn to any other section in the test.

## Section 3 - Math (No Calculator)

1. C Start by isolating the $x$ term in the equation. Subtract 3 from both sides to get $14=8 x$. Now, you want to find $4 x+9$, so instead of solving for $x$, divide by 2 to solve for $4 x$ : $7=4 x$. Add 9 to both sides to get $16=4 x+9$, which is (C).
2. B Plug In! Start with $h=2$. One hour after sunrise, the temperature will equal $5(2)+61.4=$ $10+61.4=71.4$. One hour later, $h=3$, so the temperature will be $5(3)+61.4=15+61.4=76.4$. The temperature increased $76.4-71.4=5$ degrees in one hour, which matches (B).
3. D Start by RTFQ: you want to know what " 4 " represents in the model. Next, label what you know: $H$ is the number of houses left, and $t$ is the number of hours worked. Next, try POE. " 4 " is associated with time; (C) doesn't have anything to do with time, so eliminate it. Try Plug-and-Play. Make $t=2$, so $H=35-4(2)=35-8=27$, so after 2 hours, Lee has 27 houses left to inspect. Choice (A) isn't fitting in; it's going to take longer than 4 hours to finish all the houses if he still has 27 left after 2 hours, so eliminate (A). Choice (B) doesn't make sense, as Lee has already inspected 8 houses, not 4 , so eliminate (B) and choose (D).
4. C There are a couple of approaches that work here. One is to Plug In. Make $x=2$. The problem becomes $y=4(3(2)-1)(5(2)-1)=4(5)(9)=180$. This is your target; circle it. Make $x=2$ in each answer choice and eliminate any choice which doesn't equal 180 . The only choice that works is (C).

Alternatively, you can FOIL the right side of the equation: $y=4\left(15 x^{2}-3 x-5 x+1\right)=4\left(15 x^{2}-8 x+1\right)=60 x^{2}$ $-32 x+4$, which is (C).
5. B Start by cross-multiplying: $7 x=2(2 x-30)$. Distribute the 2 on the right side of the equation: $7 x=4 x-60$. Subtract $4 x$ from both sides: $3 x=-60$. Divide both sides by 3: $x=-20$. Be careful! The question is asking for $\frac{x}{2}$, so you need to divide both sides by 2 : $\frac{x}{2}=-10$, which is (B).
6. D You could Plug In the Answers on this question, but the answer choices are not nice to Plug In, so solve the question algebraically instead. Start by multiplying both sides by $y-7$ to clear the fraction: $4(y-7)=y+7$. Distribute the 4 on the left side of the equation: $4 y-28=y+7$. Subtract $y$ from both sides: $3 y-28=7$. Add 28 to both sides: $3 y=35$. Finally, divide both sides by 3 to find that $y=\frac{35}{3}$, which is (D).
7. A Find the slope-intercept forms of the equations of the two lines, $y=m x+b$, where $m$ stands for slope and $b$ stands for the $y$-intercept. First, use the slope formula to find the slope of line $l:=\frac{y_{2}-y_{1}}{x_{2}-x_{1}}: \frac{5-3}{2-1}=2$. To find the $y$-intercept, plug in a point for the $x$ and $y$ values. Using (1,3), you get 3 $=2(1)+b$, or $3=2+b$. Subtract 2 from both sides to find $b=1$, so the equation of line $l$ is $y=2 x+1$. You are
already given the slope of line $m$, so you can do the same with the point $(1,4)$ to find $b: 4=1+b$. Subtract 1 from both sides and $b=3$, so the equation of line $m$ is $y=x+3$. At the point of intersection the $x$ and $y$ values are equal, so you can set the $x$ portions of the equations equal to each other: $2 x+1=x+3$. Subtract $x$ from both sides to get $x+1=3$. Subtract 1 from both sides to find $x=2$. To find the $y$-value at the point of intersection, plug $x=2$ into one of the original equations: $y=2(2)+1$, so $y=5$. Therefore, $(a, b)$ is $(2,5)$. Finally, the question wants $a-b$, so $2-5=-3$, which is (A).
8. D When two graphs intersect, the $x$-values are equal and the $y$-values are equal. The $y$-values of the points of intersection are 36 (because all points on the line $y=36$ have a $y$-value of 36). Make $y=36$ in the equation of the parabola and solve for the $x$-values of the points of intersection. If $36=(x+4)^{2}$, you can solve by first taking the square root of both sides (remember that you'll get positive AND negative values on the left side!): $\pm 6=x+4$. It will be easier to break this into two equations: $6=x+4$ and $-6=x+4$. Subtract 4 from both sides of both equations to get $2=x$ and $-10=x$. That gives you two points: $(2,36)$ and $(-10,36)$. You don't need the distance formula because the $y$-values are equal; simply take the positive difference of the $x$-values: $2-(-10)=12$, (D).
9. C If $f(2)=6$, then when $x=2$, the function is equal to 6 . Put these values into the equation and solve for $c: 6=-2\left(2^{2}\right)+c ; 6=-8+c ; c=14$. Then, make $x=-2$ with the known value of $c=14$ : $f(-2)=-2(-2)^{2}+14=-8+14=6$, which is (C).
10. D Apply the Geometry Basic Approach, but use some flexibility and Plugging In. Because there is already a diagram, start with labeling what you can. There are no values given in the question, but you do have a relationship among the angles with measures $a^{\circ}, b^{\circ}, c^{\circ}$, and $d^{\circ}$. Because the angles with measures $a^{\circ}$ and $d^{\circ}$ are opposite angles, they must be equal; make $a=d=50$ and label it in the diagram. Plugging those values into the equation gives you $50+c=b+50$. If you subtract 50 from both sides, you get $c=b$. Angles with measures $b^{\circ}$ and $c^{\circ}$ also complete the straight angle with the angle with measure $a^{\circ}$. $a+b+c=180$, and because $a=50$ and $b=c, 50+b+b=180 ; 50+2 b=180 ; 2 b=130 ; b=65$. Label $b=65$ and $c=65$. Because the angle with measure $e^{\circ}$ is opposite the angle with measure $b^{\circ}$, the angle with measure $e^{\circ}$ must also equal $65^{\circ}$. Because the angle with measure $c$ is opposite the angle with measure $f, f$ must equal $65^{\circ}$. Now that you have all angles indicated, you can go to the answers. You're looking for the choice that could be false, so eliminate anything that must be true. Both $b$ and $c$ are $65^{\circ}$, so eliminate (A). The same is true for $e^{\circ}$ and $f^{\circ}$; eliminate (B). Angles with measures $c^{\circ}$ and $f^{\circ}$ are also both $65^{\circ}$, so eliminate (C) and choose (D).
11. A This problem is a bit on the wordy side, so be sure to start with Reading the Full Question. The question wants the average price of a cup of coffee when the two prices are equal; in other words, what's the value of $T$ when $T=M$ ? To find this, set the two right sides of the equations equal to each other to find $y$, then plug that value back in to either equation to find $T$. First, setting the two equations equal to each other yields $1.35+0.75 y=2.25+0.60 y$. You want to isolate $y$, so start by subtracting $0.60 y$ from both
sides: $1.35+0.15 y=2.25$. Subtract 1.35 from both sides: $0.15 y=0.90$. Now, dividing with decimals can be tricky, so multiply both sides by 100 to get rid of the decimals: $15 y=90$. Divide both sides by 90 and you get $y=6$. The question wants the value of $T$ (or $M$, as they're equal), so you need to plug $y=6$ back into one of the equations. It's probably easier to use the $T$ equation, based on what you're multiplying, so make $y=6$ in the second equation: $T=2.25+0.60(6)$. Multiply 0.60 by $6: T=2.25+3.60$. Add, and you get $T=5.85$, which is (A).
12. D There are a few ways to find the vertex of this quadratic. In this case, the equation is given in its factored form; this makes it easiest to find the zeros of the quadratic. The $x$-value of the vertex of a quadratic is the midpoint of its zeros (or any two points on the quadratic which share a $y$-value); from there, you can find the $y$-value. First, to find the zeros, set $y=0: 0=a(x+6)(x-2)$. The question indicates that $a$ is nonzero, so either $(x+6)$ or $(x-2)$ is equal to zero, which means $x=-6$ or 2 . Find the midpoint by finding the average of -6 and 2: $\frac{-6+2}{2}=-2$. This is the $x$-value of the vertex. To find $k$ (the $y$-value at the vertex), plug in $x=-2$ into the equation and solve: $y=a(-2+6)(-2-2)=a(4)(-4)=-16 a$, which matches (D).
13. B A line passing through the origin has a $y$-intercept of 0 , so the slope-intercept form of the equation of this line is $y=6 x$. Plug in the $x$ and the $y$ from each answer choice until one works in the equation. Remember that the $x$ value comes first in the $(x, y)$ pair. The only choice that works is (B).
14. D While you could Plug In on this question, it is easier to solve this problem algebraically.

Use the bow tie to add the two fractions in the denominator to get $\frac{1}{\frac{a+4+a+5}{(a+5)(a+4)}}=\frac{1}{\frac{2 a+9}{a^{2}+9 a+20}}$.
When dividing fractions remember to flip the second fraction and multiply to get
$1 \times \frac{a^{2}+9 a+20}{2 a+9}=\frac{a^{2}+9 a+20}{2 a+9}$.
15. A The answer choices all resemble the quadratic formula (the square roots and the $\pm$ signs help
you recognize this). Start by putting the original equation into the $a x^{2}+b x+c=0$ form of the equation to get $x^{2}+\frac{q}{3} x+\frac{1}{2} r=0$. This means that $\mathrm{a}=1, b=\frac{q}{3}$, and $c=\frac{1}{2} r=\frac{1}{2}$. Plug these values into the quadratic formula, $\frac{-b \pm \sqrt{b^{2}-4 a c}}{2 a}$, to get $\frac{-\frac{q}{3} \pm \sqrt{\left(\frac{q}{3}\right)^{2}-4(1)\left(\frac{r}{2}\right)}}{2(1)}$. Simplify this expression to get $\frac{-\frac{q}{3} \pm \sqrt{\frac{q^{2}}{9}-2 r}}{2}$.

Next split the fraction into two to get $\frac{-\frac{q}{3}}{2} \pm \frac{\sqrt{\frac{q^{2}}{9}-2 r}}{2}$. Use Bite-Sized Pieces to solve. The first fraction becomes $-\frac{q}{3} \div 2=-\frac{q}{3} \times \frac{1}{2}=-\frac{q}{6}$. Eliminate (C) and (D). Next, determine a way to get rid of the fraction in the numerator of the second fraction. To do so, multiply $2 r$ by $\frac{9}{9}$ to get $\sqrt{\frac{q^{2}}{9}-2 r\left(\frac{9}{9}\right)}=\sqrt{\frac{q^{2}}{9}-\frac{18 r}{9}}$. Factor out a $\frac{1}{9}$ to get $\sqrt{\frac{1}{9}\left(q^{2}-18 r\right)}=\frac{1}{3} \sqrt{q^{2}-18 r}$. Now it's clear that the radical in the numerator should be $\sqrt{q^{2}-18 r}$, which means the correct answer is (A).
16. 5 Isolate $x$ by first adding 25 to both sides of the equation to get $x^{2}=25$. Next, take the square root of both sides to get $x= \pm 5$. Because the question indicates that $x>0, x$ must equal the positive value 5 .
17. $\frac{\mathbf{5}}{\mathbf{1 3}}$ or $\mathbf{3 8 4}$ or $\mathbf{. 3 8 5}$ Remember SOHCAHTOA. $\cos =\frac{\text { adjacent }}{\text { hypotenuse }}$. Therefore, the adjacent side of angle $a$ is equal to 5 , and the hypotenuse of the triangle is equal to $13 . \sin =\frac{\text { opposite }}{\text { hypotenuse }}$. The opposite side of angle $b$ is equal to 5 , and the hypotenuse of the triangle is 13 . Therefore, $\sin b^{\circ}=\frac{5}{13}$.
18. $\mathbf{1 3 0}$ Start by labeling the angle with measure $c$ as 65 . Because two sides of the triangle are equal, you also know that the other angle adjacent to line $m$ is also equal to 65 . Because these angles are part of a triangle, and all triangles have $180^{\circ}$, the measure of the remaining angle is $180-65-65=50$; label that as well. To find $b$, use the equation given; if $c=65$, then $180-2(65)=b$, so $180-130=50=b$; label the angle with measure $b$ as 50 . Finally, to find $a$, you know that the full circle around the middle of the two triangles is $360^{\circ}$, so $50+50+a+a=360$, or $100+2 a=360$. Subtract 100 from both sides: $2 a=260$. Divide both sides by 2 , and you get $a=130$.
19. $\mathbf{2}$ To find $a$, you want to find a way to clear the $b$ terms from the system of equations. The coefficients on the $b$ terms are 3 and 1 , so you can multiply the second equation by -3 and add the equations together. Multiplying the second equation by -3 gives you $-3 a-3 b=6$. Stack the equations and add:

$$
\begin{aligned}
a+3 b & =-10 \\
+(-3 a-3 b & =6) \\
\hline-2 a & =-4
\end{aligned}
$$

Divide both sides by -2 and you find that $a=2$.
20. $\frac{17}{4}$ or 4.25 There are many ways to isolate $y$ in this question. One of the more straightforward ways is to actually find $x$ first by clearing the $y$ terms. The coefficients on $y$ are 8 and -4 , so if you multiply the second equation by 2 and add the two equations together, the $y$ terms cancel. Multiplying the second equation by 2 gives you $6 x-8 y=86$; stack this with the first equation and add:

$$
\begin{aligned}
2 x+8 y & =74 \\
+6 x-8 y & =86 \\
\hline 8 x & =160
\end{aligned}
$$

Divide both sides by 8 to find that $x=20$. Now, go back to one of the original equations to find $y$. In the first equation, make $x=20: 2(20)+8 y=74 ; 40+8 y=74$. Isolate $y$ by first subtracting 40 from both sides: $8 y=34$. Next, divide both sides by $8: y=\frac{34}{8}$, or 4.25. The fraction will fit into the Grid-In boxes, so you don't need to simplify.

## Section 4 - Math (Calculator Allowed)

1. C If Casey stopped for breakfast, then she isn't moving relative to her home. Therefore, you want the point on the graph where the $y$-value (distance from home) isn't changing for 45 minutes. That can be found between the hours of 10 A.m. and 11 A.m. It looks as though she stopped somewhere shortly after 10 A.m., making (C) the best answer.
2. B As with any Math question with figures, start by reading the axes. The vertical axis is "Sales (in thousands of homes)" and the horizontal axis is "Years since 2002." Next, Read the Full Question. Because the question wants the trend in home sales from 2002 through 2014, and the vertical axis is years since 2002, the answer should describe the behavior of the entire graph. This graph increases until 5 years after 2002 (which would be $2002+5=2007$ ), then decreases. This matches (B).
3. A Because both pairs of lines are parallel, all big angles are equal, all small angles are equal, and any big angle plus any small angle equals $180^{\circ}$. Angle 1 is a big angle, and angle 2 is a small angle, so $\angle 1+\angle 2=180^{\circ}$. If angle 1 is $135^{\circ}$, then $135^{\circ}+\angle 2=180^{\circ}$. Subtract 135 from both sides to find that $\angle 2=45^{\circ}$, (A).
4. B Use values from the chart to see which equation works. According to the chart when $x=2$, $g(x)=4$. So, in the answers plug in 2 for $x$ and see which answer returns a value of 4 . Choice (A) becomes $2(2)-1=3$. Eliminate (A). Choice (B) becomes $3(2)-2=4$. Keep (B) but check the remaining answers just in case. Choice (C) becomes $4(2)-3=5$. Eliminate (C). Choice (D) becomes 5(2) $-4=6$. Eliminate (D).
5. A The question might be a little messy, but the answer choices help you figure out that you want to solve the equation for $d$. Start by dividing both sides by $4 \pi b$, giving you $\frac{L}{4 \pi b}=d^{2}$. Take the square root of both sides to get $d=\sqrt{\frac{L}{4 \pi b}}$, which is (A).
6. D A positive association between two variables means that as one variable increases, the other variable also increases. Choice (B) has $w$ decreasing as $n$ increases, so eliminate it. Additionally, (C) has $w$ increase then decrease, rather than just increase; eliminate (C). For a weak positive association, $w$ should increase slowly as $n$ increases; (A) has $w$ increasing rapidly when compared to (D). Choose (D).
7. C Plug In the Answers! The question wants the number of games Salazar played. Start with (B). If Salazar played 27 games, and he played 13 more games than Perry, then Perry played $27-13=14$ games, giving the two of them a total of $27+14=41$ games. However, they played a total of 53 games, which means you need a higher number; eliminate (A) and (B). Try (C). If Salazar played 33 games, then Perry played $33-13=20$ games, giving a total of $33+20=53$ games between the two of them, which is what you want. Choose (C).
8. B Whenever you have a graph question, always consider the axes. Here, the question wants you to label the horizontal $(x-)$ axis, which only has numbers so far. The question stem tells you the total population is $3,489,000,000$, so if you determine the total of the six countries as given in the graph, you can determine the label. Adding up the six countries gives you about 3,500 as a population. 3,489,000,000 is about a million times bigger than $3,500(3,489,000,000 \div 3,500 \approx 1,000,000)$, so the label on the horizontal axis should be in millions of people, which is (B).
9. A Sketch a graph. Quadrant III is the lower-left quadrant of the $x y$ plane, so draw a line which goes through the other three quadrants but avoids quadrant IV:

To do so, you need to make line $l$ have a negative slope, so $m$ must be negative. This matches (A).
10. A Start by labeling what you know: $D$ is the dollars remaining, and $x$ is the number of days since payday. Because 165.29 is multiplied by $x$ it is something that happens each day after payday. Use POE. Choice (B) is about payday, not something that happens every day after payday. Eliminate (B). Choice (D) is a fixed number and therefore not something that happens every day after pay day, so eliminate (D). Given that $D$ is the amount of dollars remaining in Kabir's bank account $x$ days after payday, Kabir must have had $2,314.05$ in his account on payday. Therefore, the difference between the amount of money in the Kabir's account at payday and the amount of money in his account must be $2,314.05-D$. Eliminate (C).
11. D With functions, remember to follow PEMDAS, especially working from inside to outside. To find the value of $g(f(6))$, start with the innermost pair of parentheses. The question tells you that $f(6)=5$, so you can substitute 5 for $f(6): g(f(6))=g(5)$. The question then tells you that $g(5)=7$, so $g(f(6))=g(5)=7$, which is (D).
12. A Use the equation $f=\mu N$ and the chart to determine the friction. The value of $\mu$ will be the coefficient between two pieces of wood, which is 0.28 , and the value of $N$ is the force pressing the two pieces of wood together, 30 Newtons. Plugging these values into the equation gives you $f=(0.28)(30)=8.4$, which is $(\mathrm{A})$.
13. B $\quad N$ is the force pressing the bodies together in Newtons, and according to the question the force pressing two stacked objects together is equal to the weight of the object on top. Begin by finding the weight of the piece of wood. The given equation for friction is $f=\mu N$. The value of $f$ is 22.5, and from the chart the coefficient of friction between wood and stone, $\mu$, is 0.30 . Plug these values into the equation: $22.5=0.30 N$. Divide both sides by 0.30 to find the value of $N: \frac{22.5}{0.30}=75$. Since the piece of wood will be placed on another surface, its weight of 75 N remains the force pressing the two bodies together. To determine the new surface, find the new coefficient of friction by using the value of $N, 75$, and the new value of friction, $46.5: 46.5=\mu(75)$. Divide both sides by 75 to isolate $\mu: \frac{46.5}{75}=0.62$. The chart indicates that the coefficient of friction equals 0.62 between wood and concrete, so the new surface must be concrete, which is (B).
14. A Work this problem in Bite-Sized Pieces. You want to find the difference between compounding monthly and compounding quarterly. The question indicates that $n$ is the number of times per year interest is compounded. If the interest is compounded monthly, then that would be 12 times per year, so $n=12$. In the expression, that is $\left(1+\frac{0.05}{12}\right)^{12}-1$. If the interest is compounded quarterly, then that
would be 4 times a year, so $n=4$ and the expression is $\left(1+\frac{0.05}{4}\right)^{4}-1$. The question wants the difference between these two amounts, so you would subtract: $\left[\left(1+\frac{0.05}{12}\right)^{12}-1\right]-\left[\left(1+\frac{0.05}{4}\right)^{4}-1\right]$, which matches (A).
15. B The $P$-intercept will be when items sold, $s$, equals 0 . When $s=0, P=10$, which means Jack's pay when he sells no items is 1,000 dollars (remember to check your units on each axis). Because this is Jack's pay when he sells no items, any answer choice which refers to items doesn't fit; the only choice which does fit is (B).
16. D To find the expression that describes the graph, plug in a point on the graph. When $s=10, P=15$. Plug these values into each choice and eliminate what is not true; the only choice that is true with those values is (D).
17. C Plug in! Make $w=2$. If the car costs $\$ 25.50$ per day, and 2 weeks is 14 days, then the total cost would be $25.50 \times 14=\$ 357.00$. This is your target; circle it. Make $w=2$ in each answer choice and eliminate any answer that doesn't equal $\$ 357.00$. Only (C) works.
18. D When confronted with a bunch of text in a Math section, start with the question first. The question asks for the best conclusion "based on the design and results of the research." So determine the important facts about the design and results of the research and underline them. There was a "wide range of vehicle makes, models, and model years" and " 400 vehicles were randomly selected." Which vehicle received which oil was "random," and the vehicles which receive oil $E$ had "substantial improvements in gas mileage" compared to the other group. Now, work POE in the answer choices. You don't know about other available engine oils, so you cannot claim that $E$ is better than "any other available engine oil"; eliminate (A). Choice (B) seems to fit the facts, so keep it. Choice (C) is extreme; even though there was a random sampling of vehicles, you don't know about "any vehicle," ("any" implies "any and all"—every single vehicle without exception) whereas (B) doesn't have this issue. Eliminate (C). Choice (D) is similar to (B). Comparing the two choices, (B) indicates that oil E was the "cause" of the improvement in the gas mileage, but (D) only says that it is "likely to improve" gas mileage. Choice (D) is a safer conclusion than (B) because it makes a less strong, less sweeping conclusion, so the best answer is (D).
19. A The place where $h(x)$ is at its maximum is when the $y$-value of the graph is at its highest. The graph's $y$-value is highest at $(1,2)$. (Be careful: the origin is NOT in the middle of the grid!) Therefore, the $x$-value is 1 , which is (A).
20. B The median household income represents the middle income if all incomes were listed consecutively. The mean household income is the average (total income divided by number of people). For the mean to be higher than the median, there must be a some values above the median (to "pull" the mean above the median). In this case, that means there needs to be some incomes greater than the rest to "pull" the mean above the median; this matches (B).
21. D Be sure to start by Reading the Full Question! You are given $2 x-3$, and you want $2 x+3$. To get from $2 x-3$ to $2 x+3$, you would add 6 , so add 6 to both sides of the inequality to get $2 x+3 \leq 11$. The greatest value of $2 x+3$ would therefore be 11 , (D).
22. A This question may look scary, but the answers give you a hint: you want to solve for $\varepsilon_{0}$. Start by getting $\varepsilon_{0}$ out of the denominator by multiplying both sides by $\varepsilon_{0}: E \varepsilon_{0}=\frac{q}{4 \pi R^{2}}$. Divide both sides by $E$ and you get $\varepsilon_{0}=\frac{q}{4 \pi R^{2} E}$, which matches (A).
23. B Distance in the equation is given by $R$. If the electric field strength at point $x$ is $E_{x}$ and the electric field strength at point $y$ is $E_{y}$, then $E_{x}=\frac{1}{25} E_{y}$. Make $R_{x}$ and $R_{y}$ the distances at points $x$ and $y$, respectively, and substitute the equations for the electric field strengths: $\frac{q}{4 \pi \varepsilon_{0}\left(R_{x}\right)^{2}}=\frac{1}{25}\left(\frac{q}{4 \pi \varepsilon_{0}\left(R_{y}\right)^{2}}\right)$. Multiply both sides by $\frac{4 \pi \varepsilon_{0}}{q}$ to clear these elements from both sides of the equation, leaving you with $\frac{1}{\left(R_{x}\right)^{2}}=\frac{1}{25}\left(\frac{1}{\left(R_{y}\right)^{2}}\right)$. Cross-multiply to get $25\left(R_{y}\right)^{2}=\left(R_{x}\right)^{2}$. Take the square root of both sides to get $5 R_{y}=R_{x}$. This means $x$ must be 5 times further than $y$, which is (B).
24. C Work the problem in Bite-Sized Pieces. The standard form of the equation of a circle is $(x-h)^{2}+(y-k)^{2}=r^{2}$, where $(h, k)$ is the center of the circle and $r$ is the radius. If the center of the circle is at $(5,0)$, then the left side of the equation should be $(x-5)^{2}+(y-0)^{2}$, which is the same as $(x-5)^{2}+y^{2}$. This must be part of the answer; eliminate (B) and (D). Next, you need to find the radius. If $\left(6, \frac{12}{5}\right)$ is on the circle, then the distance from $(5,0)$ to $\left(6, \frac{12}{5}\right)$ will be the radius. Use the distance formula:
$d=\sqrt{(6-5)^{2}+\left(\frac{12}{5}-0\right)^{2}}=\sqrt{(1)^{2}+\left(\frac{12}{5}\right)^{2}}=\sqrt{1+\frac{144}{25}}=\sqrt{\frac{169}{25}}=\frac{13}{5}$. But be careful! The standard form of the equation is equal to $r^{2}$, not $r$, so the right side of the equation should be $\left(\frac{13}{5}\right)^{2}$, or $\frac{169}{25}$, which gives you (C).
25. D Start by using Process of Elimination. The question wants the grams of methyl alcohol of solution $T$ and solution $S$ was $25 \%$ less than solution $T$, which means if solution $S$ had 120 grams, solution $T$ must have more than 120 grams; eliminate (A) and (B). Next, Plug In the Answers. Between (C) and (D), it will be easier to work with (D) because 160 is an easier number. The question is asking for grams of methyl alcohol in solution $T$, so if solution $T$ has 160 grams, and solution $S$ is $25 \%$ less, then solution $S$ must be $160-(0.25)(160)=120$ grams. This fits the information in the question; choose (D).
26. C There are a lot of words here, so start with RTFQ. The question wants the statement which correctly compares the average rates of infection for the two populations of trees. Looking at the graph, at first grapefruit increases faster than orange, but at the end orange has increased its rate to catch up to grapefruit. Eliminate choices (A) and (B) because both indicate that the difference in the rates was constant, which contradicts one getting ahead then the other catching up. Choice (C) says that grapefruit was faster first, so keep it. Choice (D) says that orange was faster first, which contradicts what the graph shows, so eliminate ( D ) and choose (C).
27. C There's a lot going on here, but the answer choices give you a clue: you want to solve the equation for $R$. Start by clearing the fraction by multiplying both sides by $\sqrt{1+R}: I \sqrt{1+R}=P T$. Divide both sides by $I: \sqrt{1+R}=\frac{P T}{I}$. Clear the radical by squaring both sides: $1+R=\left(\frac{P T}{I}\right)^{2}$. Subtract 1 from both sides to get $R=\left(\frac{P T}{I}\right)^{2}-1$, which is (C).
28. A Draw the lines into the given $x y$-plane. Both inequalities are written in slope-intercept form $y=m x+b$, where $m$ is the slope and $b$ is the $y$-intercept. The first line has a slope of $\frac{1}{2}$ and a $y$-intercept of -5 . Because $y$ is greater than or equal to the other side of the inequality, the line is solid, and all of the $y$-values above the line are shaded. The second line has a slope of 3 and a $y$-intercept of -2 . Because of the less than
sign, the second line is a dotted line, and the portion under the line is shaded. Your drawing should look like this:

The only quadrant that has no portion of it shaded is quadrant II, (A).
29. B By telling you that $f(-5)=3$, the problem is telling you that when $x=-5$, the function $(y)$ is equal to 3 . Choices (A), (C), and (D) all talk about the factors of the polynomial; factors are when the function is equal to 0 . You do not know when the function is equal to 0 , so you cannot know about any of the factors of $f(x)$; eliminate (A), (C), and (D) and choose (B). (Note: The Remainder Theorem states that the remainder when function $f$ is divided by the binomial $(x-a)$ is equal to $f(a)$; (B) essentially states this theorem as the answer.)
30. B Plug In the Answers to solve this question. First, solve for $y: 2 y=10$, which means $y=5$. Next, plug in 5 for $y$ and the values for $c$ and $d$ given in the answers into the first equation to see if the values work. Choice (A) gives you $5=-6 x^{2}+6$. Solve for $x$ to get $-1=-6 x^{2}, \frac{1}{6}=x^{2}$, and $\pm \sqrt{\frac{1}{6}}=x$. This is a real solution, so eliminate (A). Choice (B) gives you $5=-5 x^{2}+4$. Solve for $x$ to get $1=-5 x^{2},-\frac{1}{5}=x^{2}$, and $\pm \sqrt{-\frac{1}{5}}$. Since the value of the square root of a negative number is imaginary, these values will for $c$ and $d$ will have no real solution, and the answer is (B).
31. 5, 6, or 7 Work Bite-Sized Pieces and translate English to math. If Al buys 1 milkshake and $x$ cheeseburgers, then he spends 1 times the cost of a milkshake (\$4) and $x$ times the cost of a cheeseburger (\$6), which translates to $4+6 x$. This must be at least $\$ 30$; "at least" translates to $\geq$ in math, so $4+6 x \geq 30$. Subtract 4 from both sides to get $6 x \geq 26$. Divide both sides by 6 to get $x \geq 4.3$. You can't order a fractional number of cheeseburgers, so try 5 cheeseburgers. This would give a total of $4+6(5)=\$ 34$, which satisfies the question. Input 5 as your answer.
32. 650 Break the problem into Bite-Sized Pieces. First, determine how much water is added in 50 minutes. Rate $=\frac{\text { Amount }}{\text { Time }}$, so Rate $\times$ Time $=$ Amount. $7 \times 50=350$ milliliters added over 50 minutes. Add this to the original 300 milliliters: $350+300=650$.
33. 64.1 To find the mean, find the sum of all the ages and divide by the number of people: $\frac{57+59+65+48+81+76+40+58+63+69+71+63+77+71}{14}=\frac{898}{14}=64.1$.
34. 365 To solve for Siham, translate from English to math and solve the system of equations. Make the number of minutes Rama ran $r$ and the number of minutes Siham ran $s$. If Rama and Siham ran for a total of 670 minutes, then the number of minutes Rama ran plus the number of minutes Siham ran equals 670 , or $r+s=670$. For the second equation, Rama's total amount of time was 60 minutes less than Sihams, so $r=s-60$. Because you want to solve for $s$, you can substitute $s-60$ for $r$ in the first equation: $(s-60)+$ $s=670$. Combine like terms: $2 s-60=670$. Add 60 to both sides: $2 s=730$. Divide both sides by 2 , and you get $s=365$.
35. $\mathbf{8}$ Use the Geometry Basic Approach. First, write down the formula you need: the volume of a cone, which is $V=\frac{1}{3} \pi r^{2} h$. Plug in what you know: $48 \pi=\frac{1}{3} \pi r^{2}(9)$. Solve for $r$; start by combining like terms on the right: $48 \pi=3 \pi r^{2}$. Divide both sides by $3 \pi$ : $16=r^{2}$. Take the square root of both sides, and you find $r=4$. Be careful! The question is asking for diameter, so double the radius to find the diameter is 8 .
36. 5 For this function to be undefined, the denominator must be equal to 0 . So, set the denominator equal to 0 and solve: $(x-12)^{2}+14(x-12)+49=0$. Start by FOILing the first parenthesis and distributing 14 in the second: $x^{2}-24 x+144+14 x-168+49=0$. Combine like terms: $x^{2}-10 x+25=0$. You might recognize this as a perfect square; it factors to $(x-5)(x-5)=0$. Therefore, the value of $x$ that makes function $f$ undefined is 5 .
37. $\mathbf{1 4}$ Use the formula provided and the information given. If it costs $\$ 900$ for 150 customers, then $C_{1}=900$ and $Q_{1}=150$. Similarly, if it would cost $\$ 1,600$ for 200 customers, then $C_{2}=1,600$ and $Q_{2}=200$. Plug these values into the equation and solve: $M=\frac{1,600-900}{200-150}=\frac{700}{50}=14$.
38. 114 Take this in Bite-Sized Pieces. If the actual cost is $50 \%$ greater than expected, and Carol expected the cost to be $\$ 1,600$ (as question 37 tells us), then the actual cost was $1,600+0.50(1,600)=$ $\$ 2,400$. This is new value of $C_{2}$. Plug this value into the equation, using the same values as before for $C_{1}, Q_{2}$, and $Q_{1}: M=\frac{2,400-900}{200-150}=30$. To find the percent increase in marginal cost, use the equation percent change $=\frac{\text { difference }}{\text { original }} \times 100$. In question 37 you determined the original value was 14 , so the percent change is $\frac{30-14}{14} \times 100=114 \%$.

## Practice Test 6

## Math Test - No Calculator

## 25 MINUTES, 20 QUESTIONS

Turn to Section 3 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-15, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 16-20, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 16 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is not permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$V=\frac{1}{3} \ell w h$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

1

$$
\begin{aligned}
& 2 s-3 t=10 \\
& 6 s-2 t=16
\end{aligned}
$$

Which of the following ordered pairs $(s, t)$ satisfies the system of equations above?
A) $(-2,0)$
B) $(2,-2)$
C) $(-2,2)$
D) $(2,0)$

## 2

Which of the following expressions is equal to 3 for some integer value of $k$ ?
A) $4 k+3$
B) $1-3 k$
C) $2+2 k$
D) $-k+3 k$

3
If $g(x)=4 x+6$, then which of the following is equivalent to $g(x+1)$ ?
A) $4 x+10$
B) $4 x+7$
C) $4 x+6$
D) $4 x+5$

## 4

A tennis ball factory manager estimates the number of non-defective balls that can be produced in a day using the expression $10,000-d h$, where $d$ is the average number of defective balls produced per hour and $h$ is the number of hours in a day's shift. Which of the following is the best interpretation of the number 10,000 in the expression?
A) The factory produces 10,000 non-defective balls in a day.
B) The factory produces 10,000 defective balls in a day.
C) The factory produces 10,000 non-defective balls and 10,000 defective balls in a day.
D) The factory produces a total of 10,000 balls in a day.

The total number of constitutional amendments adopted by the U.S. Congress from 1791 to 1992 is three less than three times the number of constitutional amendments adopted by the U.S. Congress in the year 1791. If the total number of constitutional amendments adopted by the U.S. Congress from 1791 to 1992 is 27 , and the U.S. Congress adopted $p$ constitutional amendments in 1791 , which of the following equations is true?
A) $27-3 p=3$
B) $3 p=27$
C) $3 p=30$
D) $27=3 p+3$

6

$$
\left(m^{4} n+3 m-n m^{2}\right)-\left(2 n m^{2}-m^{4} n+3 m\right)
$$

Which of the following is equivalent to the expression above?
A) $-m^{4} n-n m^{2}$
B) $m n^{4}-6 m-3 n m^{2}$
C) $2 m^{4} n-3 n m^{2}$
D) $2 m^{4} n+6 m+n m^{2}$

If $\frac{y}{y+z}=\frac{2}{5}$, which of the following must also be true?
A) $\frac{y}{z}=\frac{2}{3}$
B) $\frac{z}{y}=\frac{5}{2}$
C) $y-z=1$
D) $y z=4$

8

In the $x y$-plane above, line $m$ is parallel to line $n$. What is the value of $a$ ?
A) 3
B) 4
C) 6
D) 8

$$
s E=360
$$

In a regular polygon, the measure of an exterior angle $E$, in degrees, is related to the number of sides, $s$, of the polygon, as shown in the formula above. If the measure of an exterior angle is less than $80^{\circ}$, what is the least number of sides it can have?
A) 4
B) 5
C) 6
D) 7

10
Which of the following equations has the graph in the $x y$-plane such that $y$ is always greater than or equal to -3 ?
A) $y=x^{3}-4$
B) $y=|x|-4$
C) $y=x^{2}-4$
D) $y=(x-4)^{2}$

12
Which of the following complex numbers is equivalent to $\frac{5-3 i}{6+4 i}$ ?
(Note: $i=\sqrt{-1}$ )
A) $\frac{5}{6}-\frac{3 i}{4}$
B) $\frac{5}{6}+\frac{3 i}{4}$
C) $\frac{9}{26}-\frac{19 i}{26}$
D) $\frac{9}{26}+\frac{19 i}{26}$

What is the sum of all values of $p$ that satisfy $3 p^{2}-18 p+9=0$ ?
A) -6
B) $-2 \sqrt{6}$
C) $2 \sqrt{6}$
D) 6

14
If $2 a+b=6$, then what is the value of $\left(9^{a}\right)\left(3^{b}\right) ?$
A) $3^{3}$
B) $3^{6}$
C) $27^{6}$
D) It cannot be determined from the information given.

If $(2 x+a)(3 x+b)=6 x^{2}+c x+12$ for all values of $x$, and $a+b=7$, then what are all possible values of $c$ ?
A) 3 and 4
B) 6 and 12
C) 8 and 9
D) 17 and 18

16
17
At a dessert shop, each cupcake has 60 more grams of sugar than each frozen yogurt. If 3 cupcakes and 4 frozen yogurts have a total of 390 grams of sugar, how many grams of sugar does each cupcake have?

18
If one angle of a right triangle measures $a^{\circ}$, and the $\cos a^{\circ}=\frac{3}{5}$, then what is $\sin (90-a)^{\circ}$ ?

$$
\begin{array}{r}
12 x+3 y=90 \\
a x+b y=15
\end{array}
$$

In the system of equations above, $a$ and $b$ are
constants. If the system has no solutions, what is the value of $\frac{b}{a}$ ?

# Math Test - Calculator 

## 55 MINUTES, 38 QUESTIONS

Turn to Section 4 of your answer sheet to answer the questions in this section.

## DIRECTIONS

For questions 1-30, solve each problem, choose the best answer from the choices provided, and fill in the corresponding circle on your answer sheet. For questions 31-38, solve the problem and enter your answer in the grid on the answer sheet. Please refer to the directions before question 31 on how to enter your answers in the grid. You may use any available space in your test booklet for scratch work.

## NOTES

1. The use of a calculator is permitted.
2. All variables and expressions used represent real numbers unless otherwise indicated.
3. Figures provided in this test are drawn to scale unless otherwise indicated.
4. All figures lie in a plane unless otherwise indicated.
5. Unless otherwise indicated, the domain of a given function $f$ is the set of all real numbers $x$ for which $f(x)$ is a real number.

## REFERENCE

$V=\ell w h$

$V=\pi r^{2} h$

$V=\frac{4}{3} \pi r^{3}$

$V=\frac{1}{3} \pi r^{2} h$

$V=\frac{1}{3} \ell w h$

The number of degrees of arc in a circle is 360 .
The number of radians of arc in a circle is $2 \pi$.
The sum of the measures in degrees of the angles of a triangle is 180.

Ted's Yoga studio charges a membership fee of $\$ 60$, which includes access to a locker and shower facilities. The studio then charges an additional $\$ 12.50$ per class. If Aubri's total bill for the month was $\$ 122.50$, how many yoga classes did she attend?
A) 4
B) 5
C) 9
D) 10

Greenwood Academy's softball team is trying to pick a new mascot and has narrowed down the options to the Armadillos and the Possums. The coach asks the members of the Junior Varsity and Varsity teams which mascot they prefer. The results are shown in the table below.

|  | Armadillos | Possums | Total |
| :--- | :---: | :---: | :---: |
| Junior Varsity | 14 | 11 | 25 |
| Varsity | 13 | 16 | 29 |
| Total | 27 | 27 | 54 |

If a team member is chosen at random, what is the probability that it is either a Varsity member who prefers Armadillos or a Junior Varsity member who prefers Possums?
A) $\frac{24}{54}$
B) $\frac{25}{54}$
C) $\frac{29}{54}$
D) $\frac{30}{54}$

Samantha is trying to run for City Council, but she needs to have 500 total signatures on her petition in order to get on the ballot. She currently has 284 signatures and believes that her team of volunteers can get 28 signatures per day. Which of the following represents how many signatures Samantha expects to have in $d$ days?
A) $500+28 d$
B) $28+284 d$
C) $284+28 d$
D) $500-28 d$

A veterinarian prescribes 110.25 mL of an antibiotic to her patient. The recommended dose, in mL , of the medication, $D$, is given by the equation $D=60+0.67 x$, where $x$ represents the weight of the animal in kilograms. What is the weight of the animal the veterinarian is prescribing the medication for?
A) 75
B) 105
C) 134
D) 165

5

$$
\begin{aligned}
& 3 x^{2}+4 x+7 \\
& 4 x^{2}-3 x+2
\end{aligned}
$$

Which of the following is the sum of the above two polynomials?
A) $7 x^{4}+7 x^{2}+5$
B) $7 x^{4}+x^{2}+9$
C) $7 x^{2}+7 x+9$
D) $7 x^{2}+x+9$

When 3 times the number $n$ is added to 5 , the result is 14 . What number results when 6 times $n$ is added to 11 ?
A) 14
B) 15
C) 29
D) 49

Number of Votes by Candidate
in the Southwest Region in 2012, in Thousands

|  | Number of Votes |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Arizona | California | Colorado | Nevada | New Mexico | Utah | Total |
| Obama | $1,233.7$ | $7,854.0$ | $1,323.0$ | 531.4 | 415.3 | 251.8 | $11,609.2$ |
| Romney | $1,025.2$ | $4,839.6$ | $1,185.1$ | 463.6 | 335.8 | 740.6 | $8,589.9$ |
| Other | 46.1 | 392.6 | 77.6 | 20.3 | 31.3 | 20.3 | 588.2 |
| Total | $2,305.0$ | $13,086.2$ | $2,585.7$ | $1,015.3$ | 782.4 | $1,012.7$ | $20,787.3$ |

The table above shows the number of votes cast in 2012, in thousands, in six southwestern states for the presidential election. Based on the table, if a ballot from the state of California in the 2012 presidential election is chosen at random, which of the following is closest to the probability that the ballot contained a vote for Obama?
A) 0.32
B) 0.40
C) 0.56
D) 0.60

A hospital conducted a survey to determine whether patients treated in the emergency room were satisfied with the level of care they received. The hospital mailed surveys to 550 randomly selected people who were treated in the emergency room the previous year, and 415 people responded. Which of the following factors makes it least likely that a reliable conclusion can be drawn about care-satisfaction of all emergency room patients at the hospital?
A) The survey distribution method
B) The time elapsed since the care was received
C) The size of the sample
D) The number of people who responded

9
Number of Petals on Each of 17 Flowers in a Garden

Based on the histogram above, of the following, which is closest to the average (arithmetic mean) number of petals per flower?
A) 6
B) 5
C) 4
D) 3

If the function $g$ has four distinct zeros, which of the following could represent the complete graph of $g$ in the $x y$-plane?
A)

B)

C)

D)

12
The milligrams of isotope Fermium-252 $\left({ }^{252} \mathrm{Fm}\right)$ in a sample are estimated over the course of fifteen days, as seen in the table.

| Time (days) | Amount of ${ }^{\mathbf{2 5 2}} \mathbf{F m}$ (mg) |
| :---: | :---: |
| 0 | 800 |
| 3 | 400 |
| 6 | 200 |
| 9 | 100 |
| 12 | 50 |
| 15 | 25 |

Which of the following best describes the relationship between time and the estimated milligrams of ${ }^{252} \mathrm{Fm}$ in the sample during the fifteen days?
A) Linear increase
B) Exponential growth
C) Linear decrease
D) Exponential decay

13

$$
d=v_{o} t+\frac{1}{2} a t^{2}
$$

The equation above gives the displacement $d$, in meters, of an object moving at an initial speed of $v_{o}$ meters per second for $t$ seconds. Which of the following gives acceleration constant $a$ in terms of $d$, $t$, and $v_{0}$ ?
A) $2\left(\frac{d}{t^{2}}-\frac{v_{o}}{t}\right)$
B) $2\left(d+v_{o} t\right)$
C) $-2\left(\frac{d}{t^{2}}+\frac{v_{o}}{t}\right)$
D) $-2\left(\frac{d-v_{o}}{t^{2}}\right)$

4

Heights of 4-Year-Olds (in inches)

| 24 | 34 | 35 | 36 | 36 | 37 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 38 | 38 | 39 | 40 | 40 | 41 |
| 42 | 43 | 43 | 44 | 45 | 45 |

The table above lists the heights, to the nearest inch, of a random sample of 18 four-year-olds at a school. The outlier measurement of 24 inches is an error. Of the mean, median, and range of the values listed, which will change the least if the 24 -inch measurement is removed from the data?
A) They will all change by the same amount.
B) Range
C) Mean
D) Median

## Questions 15-16 refer to the following information.

Angela is starting an exercise program that consists of swimming and lifting weights, and she is deciding what health club to join. The table below shows the initiation fee and the fees for access to the weight lifting equipment and the swimming pool for three different health clubs.

| Health |  |  |  |
| :---: | :---: | :---: | :---: |
| Club | Initiation <br> Fee, $\boldsymbol{I}$ <br> (dollars) | Fee to access <br> weight-lifting <br> equipment, $F$ <br> (dollars per <br> month) | Fee to access <br> swimming <br> pool, $\boldsymbol{S}$ |
| (dollars per |  |  |  |
| month) |  |  |  |$|$

The total cost, $y$, for the initiation fee and access to the equipment and pool in terms of the number of months, $x$, is given by $y=I+(F+S) x$.

For what number of months, $x$, will the cost of the initiation fee and the two access fees at Club M be greater than or equal to the cost of the initiation fee and the two access fees at Club N ?
A) $x \leq 5$
B) $x \leq 9$
C) $x \geq 5$
D) $x \geq 9$

16
If the relationship between the total cost, $y$, of the initiation fee and the two access fees at Club L and the number of months, $x$, for which the membership is used is graphed in the $x y$-plane, what does the $y$-intercept of the line represent?
A) The total cost of the initiation fee
B) The total monthly cost of the two access fees
C) The total monthly cost of the membership
D) The total cost of the membership

CONTINUE

17
19
The iron content of a sample of hematite, in grams, is approximately $40 \%$ greater than that of a sample of low-grade iron ore. The iron content of the lowgrade iron ore is 30 grams. Which of the following best approximates the iron content, in grams, of the sample of hematite?
A) 12
B) 18
C) 40
D) 42

18

$$
\begin{aligned}
& y<x+h \\
& y>-x+k
\end{aligned}
$$

If the point $(0,5)$ is a solution to the system of inequalities above when graphed in the $x y$ plane, which of the following must be true of the relationship between $h$ and $k$ ?
A) $h<-k$
B) $h>k$
C) $-\frac{h}{k}=1$
D) $|h|=|k|$

Average Hours Spent Using Smartphone in One Day

|  | Less than 1 | 1 to 2 | 3 or more | Total |
| :--- | :---: | :---: | :---: | :---: |
| Group A | 32 | 64 | 54 | 150 |
| Group B | 35 | 78 | 37 | 150 |
| Total | 67 | 142 | 91 | 300 |

A researcher studying the connection between depression and smartphone use asked two groups of people to record the amount of time spent using their smartphones every day for a week. The results were used to find the average time spent in one day, as shown in the table above. Group A consisted of 150 people who use iOS phones, and Group B consisted of 150 people who use Android phones. If a person is chosen at random from those who used their smartphones at least one hour, what is the probability that the person belonged to Group A ?
A) $\frac{115}{300}$
B) $\frac{118}{233}$
C) $\frac{233}{300}$
D) $\frac{118}{150}$

## CONTINUE

22

Note: Figure not drawn to scale.
In the figure $\cos \left(x^{\circ}\right)=\sin \left(y^{\circ}\right)$, where $x$ and $y$ are both less than 90 . If $x=5 c-4$ and $y=3 c+2$, what is the value of $c$ ?
A) 22.75
B) 11.50
C) 11.00
D) 7.75

Questions 23-24 refer to the following information.

The bar graph above shows the number of minutes spent per day on household tasks in Great Britain, by task, for several household tasks performed by males and females.

23
In a scatterplot of this data, where time spent by females on household tasks is plotted along the $x$-axis and time spent by males on household tasks is plotted along the $y$-axis for each of the given tasks, how many data points would be below the line $y=x$ ?
A) 2
B) 3
C) 4
D) 5

The amount of time spent by females on the care of children is approximately what percent greater than the amount of time spent by females on the care of clothes?
A) $10 \%$
B) $45 \%$
C) $56 \%$
D) $80 \%$

25

In the circle above, arc $W X Y$ is $6 \pi$ in length. If $\angle W X Y$ is $72^{\circ}$, what is the radius of the circle?
A) 6
B) 15
C) $15 \pi$
D) 30

$$
\begin{aligned}
& a(x)=x^{3}+3 x^{2}+5 x \\
& b(x)=5 x^{2}+17 x+16
\end{aligned}
$$

Polynomials $a(x)$ and $b(x)$ are defined above. Which of the polynomials below has a factor of $3 x+2$ ?
A) $l(x)=a(x)+b(x)$
B) $m(x)=3 a(x)+b(x)$
C) $n(x)=a(x)-3 b(x)$
D) $p(x)=2 a(x)+3 b(x)$

27
Assume that $a$ and $b$ are real numbers so that $b<a<\frac{a}{b}$. Which of the following statements must be true?
I. $b^{2}>a$
II. $b<1$
III. $a>0$
A) I only
B) I and II only
C) II only
D) II and III only

$$
g(x)=(x-2)(x+6)
$$

Which of the equations below represents the analogous form of function $g$, where the minimum value of $g$ appears as a constant?
A) $g(x)=(x+2)^{2}-16$
B) $g(x)=(x+2)^{2}+15$
C) $g(x)=x^{2}+4 x-16$
D) $g(x)=x^{2}+4 x-12$

## 29

Assume that a is the average of $p, 2 q$, and $4 ; b$ is the average of $2 p, 4 q$, and 8 ; and $c$ and the average of $6 p$, $3 q$, and 6 . What is the average of $a, b$, and $c$ in terms of $p$ and $q$ ?
A) $p+q+2$
B) $p+q+4$
C) $3 p+6 q+6$
D) $9 p+6 q+2$

31
A climate change panel estimates that New York City's sea levels are rising at a rate of 1.2 inches every 10 years. According to the panel's estimate, how long will it take, in years, for New York City's sea levels to rise by 14.4 inches?

In the $x y$-plane, the point $(2,10)$ lies on the graph of the function $f(x)=2 x^{2}+b x-8$. What is the value of $b$ ?

$$
c=800 t+950
$$

Swathi made an initial contribution to a Roth IRA retirement account. Each year thereafter she contributed a fixed amount to the account. The equation above models the amount $c$, in dollars, that Swathi has contributed after $t$ yearly contributions. According to the model, how many dollars was Swathi's initial contribution? (Disregard the \$ sign when gridding your answer.)

## 36

In the figure above, point $D$ is the center of the circle, line segments $A B$ and $B C$ are tangent to the circle at points $A$ and $B$, respectively, and the segments intersect at point $B$ as shown. If the circumference of the circle is 64 , what is the length of major $\operatorname{arc} A C$ ?

## Section 3: Math—No Calculator

1. B Plug In the Answers! The answer choices aren't in order, so start with (A). Make $s=-2$ and $t=0$ in the first equation: $2(-2)-3(0)=10 ;-4-0=10 ;-4=10$. This isn't true, so eliminate (A). Try (B); make $s=2$ and $t=-2: 2(2)-3(-2)=10 ; 4+6=10 ; 10=10$. This is true, so try the second equation: $6(2)-2(-2)=16 ; 12+4=16 ; 16=16$. This also works; choose (B).
2. A Set the expressions equal to 3 and solve for $k$. Eliminate any choice that does not result in an integer value of $k$. Choice (A) becomes $4 k+3=3$. Solve for $k$. Subtract 3 from both sides: $4 k=0$. Divide both sides by 4 , and you get $k=0.0$ is an integer, so (A) works and is the correct answer.
3. A Plug in! Make $x=2$. The question wants what is equivalent to $g(x+1)$, so if $x=2$, then the question really wants $g(2+1)=g(3)$. To find $g(3)$, use the function provided: $g(3)=4(3)+6=$ $12+6=18$. This is your target; circle it. Make $x=2$ in each answer choice and eliminate any choice that does not equal 18. Only (A) works.
4. D The question wants to know the meaning of the " 10,000 " in the expression. Label what you know: $d$ is the number of defective balls per hour, and $h$ is the number of hours in a day's shift. These two are multiplied together and subtracted from 10,000 . This means $d h$ must be the total number of defective balls produced in a day. Eliminate (B) because the question asks about the 10,000 , not the defective balls. You can also eliminate (A) because the number of non-defective balls must be lower than 10,000 (because you're subtracting $d h$ balls from 10,000 ). Choice (C) can also be eliminated because it doesn't account for subtracting $d h$ from 10,000 . This leaves (D), which fits the information: The non-defective balls would be the difference between the total number of balls produced and the number of defective balls produced.
5. C Translate English to math using Bite-Sized Pieces. The number of adopted amendments in 1791 is $p$. If the number of amendments from 1791 to 1992 is "three less than three times" $p$, that would be $3 p-3$. The number of amendments from 1791 to 1992 is also equal to 27 , which means $3 p-3=27$. This is not a choice, but it's enough to work some POE. Choice (A) has $-3 p$, but if you subtract $3 p$ from both sides of $3 p-3=27$ you get $-3=27-3 p$, which doesn't match (A); eliminate it. For (B), to isolate $3 p$, add 3 to both sides of $3 p-3=27$ and you get $3 p=30$; this doesn't match (B), so eliminate it. However, it does match (C), so choose (C).
6. C Work the problem in Bite-Sized Pieces, being especially careful with the negatives. Start with the $m^{4} n$ terms: $m^{4} n-\left(-m^{4} n\right)=2 m^{4} n$. This must be part of your answer; eliminate (A) and (B). Next, work the $m$ terms: $3 m-3 m=0$. There should be no $m$ terms as part of your answer; eliminate (D) and choose (C).
7. A Plug in! Choose numbers that fit the equation given and make the math easy; make $y=2$ and $z=3$. The only choice that works is (A).
8. C If the two lines are parallel, then they must share the same slope. Start by finding the slope of line $n$ by using the formula $=\frac{y_{2}-y_{1}}{x_{2}-x_{1}}: \frac{0-(-3)}{4-0}=\frac{3}{4}$. The slopes of both lines are therefore equal to $\frac{3}{4}$. To find $a$, reuse the slope formula, this time using points $(-8,0)$ and $(0, a)$ :
$\frac{3}{4}=\frac{0-a}{-8-0}$. Simplify the right side of the equation to get $\frac{3}{4}=\frac{a}{8}$. Cross-multiply to find $4 a=24$. Divide both sides by 4 and you find that $a=6$, which is (C).
9. B Plug In the Answers! Because the question wants the least number of sides, start with the least value, 4. Because $s$ is the number of sides in the equation, this means that $s=4$. Making $s=4$ in the equation gives you $4 E=360$. Dividing both sides by 4 gives you $E=90$. However, the question indicates that the measure of the exterior angle is less than $80^{\circ}$; A ) doesn't work, so eliminate it and move on to (B). If $s=5$, then $5 E=360$. Dividing both sides by 5 gives you $E=72$, which is less than 80 . There are no lesser answers remaining, so the answer must be (B).
10. D There are variables in the answers, so you can Plug In. You are looking for the choice that makes $y$ greater than or equal to -3 , so you want to test values of $x$ that may make $y$ less than -3. All of the choices contain -4 in some way, so make $x=0$. If $x=0$, (A), (B), and (C) all give you $y=-4$, which is less than -3 , so eliminate all three and go with (D). When $x=0$, (D) states that $y=16$, which is definitely greater than or equal to -3 , so it's the correct answer.
11. C If a system of two linear equations has no solutions, then the two lines never intersect and are thus parallel. Parallel lines have the same slope, so you need to find the value of $q$ that will make the first equation have the same slope as the second equation. Both equations are in standard form, which is $A x+B y=C$. In standard form, the slope of a line is $-\frac{A}{B}$. Therefore, the slope of the first equation is $-\frac{q}{-5}=\frac{q}{5}$, and the slope of the second equation is $-\frac{6}{-7}=\frac{6}{7}$. Because the slopes of these lines must be equal, set the slopes equal to each other: $\frac{q}{5}=\frac{6}{7}$. Isolate $q$ by multiplying both sides by $5: q=\left(\frac{6}{7}\right) 5=\frac{30}{7}$, which is (C).
12. C None of the answers have $i$ in the denominator, so you need to clear the $i$ in the denominator in the question. To do so, multiply the fraction by the conjugate of the complex number in the denominator over itself. To find the conjugate of a complex number, simply change the sign on the imaginary portion of the number. In this case, you need to multiply $\frac{5-3 i}{6+4 i}$ by $\frac{6-4 i}{6-4 i}$ and FOIL both the numerator and denominator: $\frac{5-3 i}{6+4 i} \times \frac{6-4 i}{6-4 i}=\frac{30-20 i-18 i+12 i^{2}}{36-24 i+24 i-16 i^{2}}$. Because
$i^{2}=-1$, you can substitute -1 for the $i^{2}$ terms: $\frac{30-20 i-18 i+12(-1)}{36-24 i+24 i-16(-1)}=\frac{30-20 i-18 i-12}{36-24 i+24 i+16}$.
Next, combine like terms in both the numerator and denominator: $\frac{18-38 i}{52}$. Because the choices are given as two separate fractions, split the numerator into two fractions: $\frac{18}{52}-\frac{38 i}{52}$.

This doesn't yet match any answer choices (you have to reduce), but you can eliminate (B) and
(D) because the second term is subtracted from the first, not added. Take a Bite-Sized Piece;
reducing the first fraction, $\frac{18}{52}$, gives you $\frac{9}{26}$, which eliminates $(A)$, and you can go with (C)
without reducing the second fraction.
13. D You can solve this question by factoring the quadratic, finding the individual roots, and then adding the roots together, but there's a better way. For a quadratic equation in standard form $\left(y=a x^{2}+b x+c\right)$, the sum of the roots can be found with $-\frac{b}{a}$. Here, $b=-18$ and $a=3$, so the sum of the roots is $-\frac{-18}{3}=6$, which is (D).
14. B When you have exponents, remember your MADSPM rules. In this case, when you multiply, you must add the exponents. However, to do this, you must have equal bases. Here, $9=3^{2}$, so you can rewrite the left term to $\left(3^{2}\right)^{a}$, which is equal to $3^{2 a}$. Now the expression is $\left(3^{2 a}\right)\left(3^{b}\right)$ $=3^{2 a+b}$. You know that $2 a+b=6$, so you can substitute 6 for $2 a+b$, which gives you $3^{6}$, (B). It is also possible to plug in here. Plug in for $a$, then solve for $b$. If $a=4$, then $b=-2$, giving $\left(9^{4}\right)\left(3^{-2}\right)$. Change the base of the first term to $3^{2} \times{ }^{4}$, then simplify the exponents to get $\left(3^{8}\right)\left(3^{-2}\right)=3^{6}$.
15. D When you FOIL the left side of the equation, you get $6 x^{2}+3 a x+2 b x+a b=6 x^{2}+c x+12$. Because the $x^{2}$ terms go together and the $x$ terms go together, what's left also goes together; so $a b=12$. If $a+b=7$, then you need two numbers which add up to 7 and multiply to 12 . Those two numbers are 3 and 4. (If you're struggling, list out pairs of factors of 12 and look for what pair has a sum of 7.) That means $a$ and $b$ are 3 and 4, but you don't know which is which. So pick something: make $a=3$ and $b=4$. Be careful not to stop here! Choice (A) is half right, meaning that it's all wrong! Returning to the original equation, you now have $(2 x+3)(3 x+4)=6 x^{2}+c x+12$. FOILing the left side this time gives you $6 x^{2}+17 x+12=$ $6 x^{2}+c x+12$, so one possible value of $c$ is 17 . Only ( D ) includes 17 , so it must be your answer (and there's no reason to find the other value of $c$ ).
16. $\mathbf{1 6}$ Because the flag is made up of rectangles and is itself a rectangle, and the white stripe transects each rectangle at the same angle, you can use similar triangles to find the height of the blue rectangle. The total length of the white stripe is $x+4 x+2 x+2 x+9 x$. The triangle made by the white stripe and the blue rectangle has a white stripe distance of $4 x$. The height of this triangle is proportional to the height of the whole flag: $\frac{4 x}{9 x}=\frac{y}{36}$, where $y$ is the height of the triangle formed by the white stripe crossing the blue rectangle. Solve for $y$ by first canceling the $x$ terms: $\frac{4}{9}=\frac{y}{36}$. Next, cross-multiply and divide and you get: $9 y=(4)(36)$ and then $y=16$. The height of the blue triangle is 16 .
17. 90 Translate English to math. Make $c$ the grams of sugar in a cupcake and $f$ the grams of sugar in a frozen yogurt. If each cupcake has 60 more grams of sugar than each frozen yogurt, then $c=60+f$. If 3 cupcakes and 4 frozen yogurts have 390 grams of sugar, then $3 c+4 f=390$. You want to find the grams of sugar in each cupcake. To solve for $c$, you have a few options. One is to first solve the first equation in terms of $f$ by subtracting 60 from each side: $c-60=f$. Next, substitute $c-60$ for $f$ in the second equation: $3 c+4(c-60)=390$. Next, distribute $4: 3 c+4 c-$ $240=390$. Combine like terms: $7 c-240=390$. Add 240 to both sides: $7 c=630$. Divide both sides by 7 , and you get $c=90$.

This question is testing your knowledge of the relationship between sine and cosine of complementary angles. This relationship is often expressed as $\sin x^{\circ}=\cos (90-x)^{\circ}$. The important part of the relationship is that if the angles add up to $90^{\circ}$, then the sine and cosine are equal. Here, $a^{\circ}+(90-a)^{\circ}=90^{\circ}$, so the two angles are complementary. The cosine of one angle is equal to the sine of the other angle, so if $\cos a^{\circ}=\frac{3}{5}$, then $\sin (90-a)^{\circ}=\frac{3}{5}$.

If the system of equations has no solutions, then the lines described by the equations never intersect. In other words, the lines are parallel and have the same slope. The equations are in standard form: $A x+B y=C$. Slope in standard form is $-\frac{A}{B}$. The slope of the first equation is therefore $-\frac{12}{3}=-4$. The second equation has the same slope, so $-\frac{a}{b}=-4$. The question wants $\frac{b}{a}$, so you need to do some manipulation. First, multiply both sides by $-1: \frac{a}{b}=4$. Mul-
tiply both sides by $b$ : $a=4 b$. Divide both sides by $a: 1=\frac{4 b}{a}$. Divide both sides by 4 and you get $\frac{1}{4}=\frac{b}{a}$.
20. 64 You have a system of equations and the question wants the value of $y$, so you want to make the $x$ terms go away. One way to approach this is to make the $x$ portions of the two equations equal to one another, then put the other parts of the equations equal to each other. Multiply the first equation by 4 to get $4 x=8 \sqrt{5}$. Both equations are now equal to $4 x$, so you can put the other parts of the equations equal to each other: $8 \sqrt{5}=\sqrt{5 y}$. Isolate $y$. Start by squaring both sides (don't forget to square the 8 on the left side): 64(5) $=5 y$. Divide both sides by 5 and get $64=y$.

## Section 4: Math—Calculator

1. B Work the problem in Bite-Sized Pieces. First, figure out the charge for the yoga classes. She paid a total of $\$ 122.50$, $\$ 60$ of which was for the membership fee, leaving $122.50-60=$ $\$ 62.50$ for yoga classes. If each yoga class costs $\$ 12.50$, then Aubri attended $62.50 \div 12.50=5$ yoga classes, which is (B).
2. A Probability is defined as $\frac{\text { what youwant }}{\text { total possibilities }}$. There are 13 Varsity members who prefer Armadillos and 11 Junior Varsity members who prefer Possums, making $11+13=24$ possibilities that give what you want out of 54 total members, or $\frac{24}{54}$, which is (A).
3. C Translate English to math. The question wants the expression for how many signatures Samantha expects to have in $d$ days. She currently has 284 signatures, and she will add 28 signatures each day. Because she adds 28 signatures per day, you need to multiply 28 by $d$ and add that to 284 , giving you $284+28 d$, (C). Plugging in is also an option. Plug in for $d$, and then determine how many signatures she should have. If $d=2$, then she will get $28 \times 2=56$ signatures in addition to the 284 she already has. This means she will have 340 signatures. Since this answers the question, this is the target. Circle it! Plug $d$ into the answer choices. Only (C) gives 340 as a result.
4. A The question wants you to solve for the weight of the animal, which is $x$ in the equation. The question tells you that the veterinarian prescribed 110.25 mL , which is represented by $D$ in the equation, so substitute 110.25 for $D: 110.25=60+0.67 x$. Solve for $x$. Start by subtracting 60 from both sides: $50.25=0.67 x$. Divide both sides by 0.67 to get $x=75$, which is (A).
5. D Work the problem in Bite-Sized Pieces. Start with the $x^{2}$ terms. The sum of the polynomials is the result of adding the polynomials, so the $x^{2}$ term will be $3 x^{2}+4 x^{2}=7 x^{2}$. This term should be part of your answer; eliminate (B) because it doesn't have $7 x^{2}$. Next, add the $x$ terms: $4 x+(-3 x)=x$. This should also be part of your answer; eliminate $(A)$ and $(C)$ and choose $(D)$.
6. C Start by translating English to math. "3 times the number $n$ " can be written as $3 n$. "Add to 5" means to add $3 n$ to 5 , which gives $3 n+5$. "The result is 14 " means " $=14$," so the first sentence translates to $3 n+5=14$. Before you start solving for $n$, be sure to Read the Full Question. You want " 6 times $n$ added to 11 ", or $6 n+11$. If you multiply $3 n+5=14$ by 2 , you get $6 n+10=28$. Adding 1 to both sides gives you $6 n+11=29$, (C).
7. D Probability is $\frac{\text { what youwant }}{\text { total possibilities }}$. In California, there were $7,854,000$ votes for Obama, and there were $13,086,200$ total votes in California, so the chance of selecting a vote for Obama from the total is $\frac{7,854,000}{13,086,200}=0.60$, which is (D).
8. A Work this problem in Bite-Sized Pieces. If the capacity of the pond is 5,000 fish, then the total number of fish must be less than or equal to 5,000; eliminate (B) and (D) because they do not include " $\leq 5,000$." The difference between (A) and (C) is the " $+2,300$ " in (A). This represents the initial 2,300 fish in the pond, so this must be part of the answer; choose (A).
9. B First ballpark! If the arithmetic mean is $\frac{\text { total }}{\text { number of things }}$ then the answer should be somewhere in the middle of the histogram. Eliminate (A) and (D) because they are extremes and not in the middle. To find the total, multiply the number of flowers by the number of petals per flower for each column, then add: $(2 \times 2)+(3 \times 5)+$ $(5 \times 4)+(6 \times 2)+(8 \times 4)=83$ total petals on $2+5+4+2+4=17$ flowers. The average is then $\frac{83}{17}=4.9$, which is closest to $5,(\mathrm{~B})$.
10. B Use Process of Elimination. For (A), mailing surveys is an established method of conducting surveys, and 415 out of 550 randomly chosen patients responded, so this is not a problem; eliminate (A). The survey covered patients who were treated in the previous year; there may be a problem with the time elapsed since care was received (as patients may not remember or misremember the care they received), so keep (B). Choices (C) and (D) consider similar issues. In this case, 415 respondents out of 550 selected patients is both a sufficiently large sample size and a sufficiently large response rate; eliminate (C) and (D) and choose (B).
11. C A function with four distinct zeroes will intersect the $x$-axis four times. Only (C) does this.
12. D Work Process of Elimination. As time goes on, the amount of ${ }^{252} \mathrm{Fm}$ decreases; eliminate (A) and (B). To determine whether the decrease is linear or exponential, compare the changes. From day 0 to day 3, the amount decreases by 400 mg . From day 3 to day 6, the amount decreases by 200 mg . A linear decrease would have the same change over the same time periods; eliminate (C) and choose (D).
13. A The question wants you to solve the equation for $a$. Start by subtracting $v_{0} t$ from both sides: $d-v_{0} t=\frac{1}{2} a t^{2}$. Next, divide both sides by $t^{2}$ and simplify: $\frac{d}{t^{2}}-\frac{v_{0} t}{t^{2}}=\frac{1}{2} a ; \frac{d}{t^{2}}-\frac{v_{0}}{t}=\frac{1}{2} a$. Finally, multiply both sides by 2 and you get $2\left(\frac{d}{t^{2}}-\frac{v_{0}}{t}\right)=a$, which is (A).
14. B Find the range, mean, and median of the set both with and without the erroneous measurement of 24 . Start with the range. Range is greatest value - least value, so with 24 the range is $45-24=21$, and without 24 the range is $45-34=11$. The difference is $21-11=10$. Next, find the mean. Mean is $\frac{\text { total }}{\text { number of things }}$, so first add up all numbers and divide by 18 , the number of children. The numbers add to 700 , so the mean is $\frac{700}{18}=38.9$. To remove the erroneous height, subtract 24 from the total of the heights and 1 from the total number of children: $\frac{700-24}{18-1}=\frac{676}{17}=39.8$. The mean changes by $39.8-38.9=0.9$. You can eliminate $(\mathrm{A})$ and (C), because the mean changes less than the range. Finally, find the median. With all 18 children included, the median will be the average of the 9 th and 10 th values: $\frac{39+40}{2}=39.5$. Without the value of 24 , then the median will be the middle of the 17 remaining values: the 9 th, which is 40 . The median changed $40-39.5=0.5$, which is less than the amount the mean changed, so eliminate (D) and choose (B).
15. C Set up an inequality using the numbers for Club M and Club N. At Club M, $I=100, F=15$, and $S=11$, so according to the equation the total cost is $y=100+(15+11) x$. At Club N, $I=130, F=12$, and $S=8$, making the total cost $y=130+(12+8) x$. The question wants Club M to be greater than or equal to Club N, which means $100+(15+11) x \geq 130+(12+8)$ $x$. Solve for $x$. Start by following PEMDAS and adding within the parenthesis: $100+26 x \geq$ $130+20 x$. Subtract $20 x$ from both sides: $100+6 x \geq 130$. Subtract 100 from both sides: $6 x \geq$ 30. Divide both sides by 6 , and you get $x \geq 5$, which is (C). If this is confusing, try plugging in the answers. For example, plug in for $x=4,5$, or 10 months, determine how much each club would cost, and then use POE based on Club M being as or more expensive than Club N .
16. A The $y$-intercept of a line will be where $x=0$. Take the information for Club L and make $x=0$. Using the information given in the chart, the equation for Club L is $y=150+(10+5) x$. If $x=0$, then $y=150+(10+5)(0)=150+0=150$. All that is left is $y=150$, which matches the initiation fee. The only choice which represents this is (A).
17. D First, you can work Process of Elimination. If the iron content of hematite is $40 \%$ greater than low-grade iron ore, and the iron ore already has 30 grams of iron, then the hematite must have more than 30 grams of iron. Eliminate (A) and (B). Next, if the hematite has $40 \%$ more iron, then it must have $100+40=140 \%$ of the iron content. You can find the iron content of the hematite by multiplying the iron content of the iron ore by $140 \%$ or $1.4: 30 \times 1.4=42$, which matches (D).
18. B Start by plugging in the point provided. ( 0,5 ) means that $x=0$ and $y=5$, so $5<0+h$, and $5>-0+k$. Simplifying these equations gives you $5<h$ and $5>k$. You can flip the second inequality and combine these into one because they share $5: k<5<h$. If this is true, then $k<h$, which is the same as $h>k$, which is (B).
19. C Plug In! In 5,730 years, the amount of carbon- 14 will be half what it is now. If there are 100 grams of carbon-14, in 5,730 years there will be $100 \div 2=50$ grams. Make $t=5,730$ and eliminate any choice which does not equal 50 . The only choice that works is (C).
20. A Find 7 hours on the horizontal axis. The dot represents the actual student who slept 7 hours; that student's actual score was 2 lines above 80 . Because there are 5 spaces between 80 and 90 , each line represents 2 points, so the student's score was 84 . The line of best fit goes through a score of 80 at 7 hours, so the student scored $84-80=4$ points better than the line of best fit, which is (A).
21. B Whenever you're faced with a ton of information and words, be sure to start by focusing on the question first. Here, you want to know the probability that someone is chosen from Group A if you're picking from the people who used their smartphones for at least one hour. Probability is $\frac{\text { what youwant }}{\text { total possibilities }}$, but here your "total possibilities" are only those people who use their phones for either 1 to 2 hours or 3 or more hours. Add those two groups to get the total possibilities: $142+91=233$. This number (or a factor of this number) needs to be the denominator of your answer; only (B) has 233 or a factor of 233 as a denominator, so it must be the answer. To find "what you want," add the members of Group A who are in either the 1- or 2-hour group or the 3-hour group: $64+54=118$, giving the $\frac{118}{233}$ as the probability.
22. B If $\cos \left(x^{\circ}\right)=\sin \left(y^{\circ}\right)$, then $x$ and $y$ must be complementary angles, so $x+y=90$. To find $c$, start by stacking the two equations and adding:

$$
\begin{array}{r}
x=5 c-4 \\
+y=3 c+2 \\
x+y=8 c-2
\end{array}
$$

Substitute 90 for $x+y$ : $90=8 c-2$. Add 2 to both sides: $92=8 c$. Divide both sides by 8 : $11.5=c$, which matches (B).
23. C Data points below the line $y=x$ will have a $y$ value which is less than the $x$ value. Because the time spent by females is the $x$ value and the time spent by males is the $y$ value, you want to know how many categories have the time spent by males less than the time spent by females. This is true for cooking, cleaning, care of children, and care of clothes, which is 4 categories: (C).
24. D Percent change is defined by change $=\frac{\text { difference }}{\text { original }} \times 100$. The original value is the smaller value if you want percent greater. Females spend approximately 45 hours on care of children and 25 hours on care of clothes, so change $=\frac{45-25}{25} \times 100=80 \%$, which is (D).
25. B Arc length is proportional to the circumference as the central angle is to $360^{\circ}$. Therefore, $\frac{6 \pi}{\text { circumference }}=\frac{72}{360}$. Simplify the right side of the equation (use the MATH $\rightarrow$ FRAC funccircumference on your calculator): $\frac{6 \pi}{\text { circumference }}=\frac{1}{5}$. Cross-multiply to get circumference $=30 \pi$. Because circumference is $2 \pi r$, that means $2 \pi r=30 \pi$. Divide both sides by $2 \pi$ and you get $r=15$, (B).
26. B Plug in! Make $x=2$. If this is the case, $a(2)=2^{3}+3(2)^{2}+5(2)=30$ and $b(2)=5(2)^{2}+17(2)+16$ $=70$. You are looking for the choice that has a factor of $3(2)+2=8$. In other words, the correct answer must be divisible by 8 . For $(\mathrm{A}), l(2)=a(2)+b(2)=30+70=100$. Divide 100 by 8 and you get 12.5 ; this means 8 is not a factor of 100 , so eliminate (A). For (B), $m(2)=3 a(2)+b(2)=3(30)$ $+70=160$, which, when divided by 8 , is 20 . Keep (B). Choice (C): $n(2)=a(2)-3 b(2)=30-3(70)$ $=-180$, which, when divided by 8 , equals -22.5 ; eliminate (C). Choice (D): $p(2)=2 a(2)+3 b(2)=$ $2(30)+3(70)=270$, which is equal to 33.75 when divided by 8 ; eliminate (D) and choose (B).
27. C Plug in! You need to find a set of numbers that satisfies the inequality. For $\frac{a}{b}>a$, either both $a$ and $b$ are negative, making $\frac{a}{b}$ positive, or $b$ is less than 1. For example, $a=2$ and $b=\frac{1}{2}$. Taking each item one at a time, for (I), $\left(\frac{1}{2}\right)^{2}>2$ is false; eliminate (A) and (B). Both (C) and (D) include (II), so you don't need to test (II). Statement (III) is currently true, but try new numbers: Make $a=-2$ and $b=-3$. This satisfies the initial inequality, but (III) is now false, so eliminate (D) and choose (C).
28. A The form of a quadratic that gives the minimum or maximum value as a constant is vertex form: $y=a(x-h)^{2}+k$, where the vertex is at point $(h, k)$. Choices (C) and (D) are not in this form, so eliminate them. Both (A) and (B) have the term $(x+2)$, which means the minimum must be $x=-2$ (watch the negative sign in the vertex form!). Make $x=-2$ in the original function: $g(-2)=$ $(-2-2)(-2+6)=(-4)(4)=-16$, which means the $k$ value of the vertex is -16 . Choose (A).
29. A Variables and the phrase "in terms of" are good reasons to Plug In on this question. Make $p=3$ and $q=5$. Average is the total divided by the number of things, so $a=\frac{3+2(5)+4}{3}=\frac{17}{3}$, $b=\frac{2(3)+4(5)+8}{3}=\frac{34}{3}$, and $c=\frac{6(3)+3(5)+6}{3}=\frac{39}{3}=13$. The average of $a, b$, and $c$ is therefore $\frac{\frac{17}{3}+\frac{34}{3}+13}{3}=\frac{30}{3}=10$. This is your target; circle it. Make $p=3$ and $q=5$ in each answer choice, and eliminate any choice that does not equal 10 . The only choice that works is (A).
30. C All of the answer choices are about the relationship of $x$ and $y$, so you want to get rid of the $p$ and $q$. You know that $p+q=12$, so if you can get $p+q$ somehow, you can substitute. The equations are already stacked, so add the equations together and you get $4 x+2 y+p+q=$ $3 x+10 y+12$. Substitute 12 for $p+q: 4 x+2 y+12=3 x+10 y+12$. Subtract 12 from both sides: $4 x+2 y=3 x+10 y$. Subtract $3 x$ from both sides: $x+2 y=10 y$. Subtract $2 y$ from both sides: $x=8 y$. If $x$ is 8 times $y$, then $y$ must be one-eighth of $x$, which is (C).
31. $\mathbf{1 2 0}$ Set up a proportion: $\frac{1.2 \text { inches }}{10 \text { years }}=\frac{14.4 \text { inches }}{x \text { years }}$. Cross-multiply to get $1.2 x=144$. Divide both sides by 1.2 and you get $x=120$.
32. 5 Because the point $(2,10)$ lies on the graph, you can make $x=2$ and $f(x)=10$ and solve for $b: 10=2(2)^{2}+b(2)-8 ; 10=8+2 b-8 ; 10=2 b ; b=5$.
33. $\mathbf{8 8 0}$ Over two days, the radio station airs a total of $220 \times 2=440$ minutes of advertisements. If each time slot is 30 seconds long, and each minute has 60 seconds, then there is time for $60 \div 30=2$ time slots per minute, giving a total of $440 \times 2=880$ time slots over two days.
34. 20 Average is $\frac{\text { total }}{\text { number of things }}$, which can be rearranged as average $\times$ number of things $=$ total. If the desired average for 16 posts is $75 \%$, then the sum of all the scores must be $75 \times 16=1,200 \%$. For the first 8 posts, there was a total of $60 \times 8=480 \%$, leaving $1,200-480=720 \%$ for the last 8 posts. If you want the least value for the 9 th post, then you want to assume that the 10th-16th
posts to be as high as possible, or $100 \%$. This would give $100 \times 7=700 \%$ total for the last 7 posts, making the least value possible for the 9th post $720-700=20 \%$.
35. 950 The initial contribution will be before any yearly contributions, so $t=0$. If $t=0$, then $c=800(0)+$ $950=\$ 950$. Swathi's initial contribution must therefore be $\$ 950$.
36. 40 Arc is proportionate to the central angle: $\frac{\text { central angle }}{360^{\circ}}=\frac{\operatorname{arc}}{\text { circumference }}$. For a major arc, you need to use the central angle measure that's greater than $180^{\circ}$ (the central angle measure that's less than $180^{\circ}$ is the minor arc). Therefore, here you need to find angle $A D C$ (the angle from the minor arc) and subtract that from $360^{\circ}$ to get the angle for the major arc. To get angle $A D C$, consider quadrilateral $A B C D$. A quadrilateral has $360^{\circ}$. Because $A B$ and $C B$ are tangents to the circle, angles $D A B$ and $D C B$ are each $90^{\circ}$, leaving $360-90-90-45=135^{\circ}$ for angle $A D C$. The angle you need to use to find the major arc is therefore $360-135=225^{\circ}$. Insert this into the proportion: $\frac{225^{\circ}}{360^{\circ}}=\frac{x}{64}$, where $x$ is the arc. Cross-multiply to get $14,440=360 x$. Divide both sides by 360 to get $x=40$.
37. 1.03 The given equation is the equation for exponential growth. The generic form of this equation is final amount $=$ original amount $(1 \pm \text { rate })^{\text {number of changes. The rate of growth is } 3 \text { percent, which as a }}$ decimal is equal to 0.03 . Because the question indicates that the population is growing, you need to add this to 1 , so the value in the parenthesis, $r$, is $1+0.03=1.03$.
38. 17.8 From question 37 , you determined that $r=1.03$. 2022 is 7 years after 2015 , so $y=7$. Put these into the equation to determine $P: P=14.5(1.03)^{7}=17.8$.
